# TSB steps up its automation throughout UK

by Brandon Gamester

WHILE the four big clearing banks in the UK continue to shuffle their feet at the start of the course to online, real time computerisation of customer transactions, Trustee Savings Bank of Northern Ireland last week celebrated 10 years with this level of technology. At the same time it announced an £800,000 order for terminals from Burroughs, heralding a further stage in its bank automation.

The order is for 200 modular terminals, comprising a separate disc drive unit, VDU, pass-book printer, and combined keyboard/card reader, which will be located in the 56 TSB branches throughout Ulster. Similar systems have been ordered from Burroughs by TSB Computer Services, which is introducing over 4,000 of the terminals to branches of the Trustee Savings Bank in England, Scotland and Wales.

Apart from the bank's existing capability to provide customers with account statements including the last six transactions, the new

terminals will provide access to details of a customer's banking history, enabling a manager to make decisions on overdrafts and loans, says the bank.

The use of up to 96K-bytes of storage with each terminal also allows a tally of the day's transactions to be held, and accessed via the VDU. The bank hopes this and other information held at the terminal will lessen the dependence on telephone lines to the bank's central mainframe, with the attendant risks of line failure.

The TSB went into computerisation because its transactions were particularly labour intensive. Although cheque books were not issued, many customers had sales receipts, standing orders, and giro payments on their accounts, all of which had to be recorded in pass books. There were delays at the counter and posting to accounts was done manually.

By February 1971 (just before decimalisation) the bank had provided all its branches with terminals linked online, real time to a

One of Burroughs' modular counter terminals, currently being installed in nearly 1,000 Trustee Savings Bank branches.

central computer in Belfast. The network was claimed to be the first of its kind in Europe.

Burroughs' managing director Laurie Rushton told Computer Weekly that he saw banking as his company's most important market for the next few years. The TSB was demonstrating the potential benefits available through computing, and the major clearing banks would have to follow soon if they were to keep labour costs down and remain competitive, he said.

The TSB is now looking closely at the advantages a viewpoint system could bring if integrated into the bank's terminal network.

Brian Johnston, general manager of the bank, believes that resultant savings on postal, paper and handling costs of providing circulars of instruction and current banking data, could be high. Further ahead, he sees no reason why customers should not be able to access their own account information via a television in their

homes or offices.

One of the strategies used by the TSB to attract the 60% of people who do not have a bank account is the provision of real time cash dispensers. One of these is located in Harland and Wolff's shipyard in Belfast where a special arrangement between the bank and Harland employees ensures that wages are paid directly into each employee's TSB account via the transfer of reels of magnetic tape. The money is then immediately available from the cash dispenser.

## China boom

CHINESE imports of Western communications equipment could reach \$250 million a year by 1984, according to a report from International Resource Development in the US. Imports currently stand at \$90 million a year, the report says, compared with Russian imports of \$160 million which are thought likely to decline.

China is expected to try for a quick transition to digital switching and transmission to avoid later conversions, because it currently has few telephones.

## Water will be safer

by Jack Gee

PARISIANS' drinking water will soon be safer and the risk of flooding reduced thanks to a £10 million programme to control the operation of the metropolitan area's sewers by computers.

Within five years, the rate of flow in the River Seine and the sewers will be measured at 174 catchment points by instruments linked to a central computer at Suresnes, a Paris suburb.

The computer will automatically

open sluice-gates when danger levels are reached and enable excess rainwater to be cleaned at pumping stations.

Pierre Pommellet, head of local planning for the Paris area, said the £10 million represented only two years' average expenditure on the upkeep of the Paris area sewers.

The authority's big scale order means that the price of specially designed computerised equipment for water flow control will drop to only one quarter of present levels.

## Ex-manager sets up on his own

by Kevin Cahill

MIKE EDWARDS, until recently marketing manager of the French SEMS group in the UK, has joined the growing number of entrepreneurs and started his own company.

Using his own and family money he has set up in Newbury importing the unique Canadian Q Engine which he describes as a Pascal machine, based on the 16-bit Western Digital Pascal micro engine chip set.

Edwards decided to set up on his own having taken a careful look at the bottom end of the computer market, which looked to him to be both under-exploited and more recession-proof than either the middle or top end of the market.

He made his early decision to go it alone from his own experience of selling in the UK, but decided at Compec that the product he wanted.

Edwards believes that the best opportunities for UK entrepreneurs lie in taking a product, not necessarily UK produced, and adding value via the software.

In the case of the Q Engine he plans initially to develop a general

accounting and production control package running under Series 1 Virtual Basic. This will take the machine more directly into the commercial market and Edwards intends to add cross-compilers for both Basic and Fortran, though not Cobol.

This is because the educational and scientific markets are seen as the primary area in which the Q Engine will sell initially.

Edwards has spoken to various potential backers, but prefers to put up himself the £20,000 he reckons it will take him to get going.

Mike Edwards operates the Q Engine which he will market in the UK.

## Software copying row settled

by Claire Gooding

US MICROSOFT supplier Lifeboat Associates, which distributes products from Digital Research, Microsoft and others, has come to an agreement with a small Japanese firm, Kishida, which copied and sold its software without permission.

The differences between us are resolved. Lightfoot president Tony Gold told Computer Weekly. They admitted that they made

copies of the software, based on a misunderstanding of the correct procedure. They said it was done in error, and have undertaken to replace all the discs tested with authorised copies from us.

The unauthorized marketing came to Gold's attention when he was shown a copy of one of Lifeboat's advertisements in the Japanese version of the trade journal Interface. He explained that the products being sold were copies

quilted the firm, and discussed the problem with them.

"I have no allegations of illegal conduct," he told Computer Weekly. "I have explained the correct procedure, and they have agreed to repair their error."

He added: "We are planning to set up a joint venture company in Japan to market Lifeboat products. So there will soon be a legitimate distributor out there."

## NEWS BRIEF

### Philips in US optics deal

PHILIPS is to acquire a half share of Valtec Communications Fibre Optics, one of the top three US optical fibre companies alongside ITT and Sicon (a joint venture of Siemens and Corning Glass). The other half is to be retained by communications company M/A-COM which bought all three Valtec companies last September, the other two being Laser Diode Laboratories, a coaxial cable manufacturer.

### Olivetti changes

OLIVETTI has regrouped its telecommunications-related production under one autonomous company called Oltec, headed by Carlo de Benedetti and managing director Luigi Mercurio, who data transmission networks, tele and telephone exchanges and teleprinters in Italy, Spain and Brazil.

### Illinois deal

RECOGNITION Equipment, Dallas, Texas based OCR equipment manufacturer, has signed an agreement to buy the operating assets of the Data Systems Division of the Cummins-Allison Corp of Elk Grove, Illinois, for \$1 million. The Illinois operation built a range of data entry systems, including key-to-disc and OCR, and is particularly interested in systems for cheque and remittance processing. RE's UK subsidiary is based at Slough, Berks.

### Japanese aid

FIVE South American states are keen to get Japanese help to implement packet-switched data networks, according to Japan's Communication Association of Tokyo. Brazil inaugurated a packet-switched service called Transdata last May, but wants to start a packet network by the end of next year, while Argentina plans to start one this year and Chile, Peru and Colombia plan to follow suit.

### Brazil choice

BRAZIL has picked the French Teletel videodata system for a market trial, after an investigation by Telesp, a leading Brazilian telecoms company in which France is believed to have been a favourite. The faithful wife of France's first export credit to Teletel, is believed to be worth about £1 million and to have been agreed as part of a regional package between the two governments.

### Takeover

DATA GENERAL has fulfilled its promise to take over a group of systems manufacturers (DGI, San Jose 23, 1980). The firm is a major supplier to the computer design/computer aided manufacturing industries. DG will acquire 280,000 shares worth nearly £1 million for the Megatek stock.

### IBM man jailed

GERHARD ARNOLD, a former IBM employee in West Germany, was jailed for two months on February 5 for saying on radio that IBM had given information on beyond industrial espionage to East Germany. The offence was committed between 1968 and 1975.

### \$3m SA order

THE South African Post Office has placed an order worth US\$3,100,000 for 700 branch terminals to form part of a national banking network. The order brings the total value of the post's business with the Office to \$23 million.

# Pioneer user gives thumbs up to X25

by Donald Kennett

SUPPORT for the X25 packet switching protocol as a basis for distributed data processing came from a satisfied user last week. But John Thomas, communications manager of South West University Regional Computer Centre, warned an NCC seminar on implementing an X25 interface that distributed data processing was not achieved just by plugging machines into a network. The bulk of the work involved went into the areas outside the X25 specification, he said.

Changes had been made to X25 since it was published in 1976, but it was "pretty stable" compared with work on the higher levels of

the International Standards Organisation's seven-layer networking scheme, he added.

"Beware if you think you can do-it-yourself, because the protocol specification is very much the tip of the iceberg: it doesn't say anything about management functions, the user interface or procedure calls."

The biggest problem was to produce the high-level protocols these functions depended on. Once they were in being, it was possible to switch around from one machine to another, use public networks such as PSS and gateways to other networks as much as desired, he said.

Exeter University, one of the

five directly connected to SWURCC, is also using X25 for local networking in a pilot scheme based on a GEC packet switching exchange, set up in co-operation with the Computer Board's Joint Network Team.

X25 made interconnection of networks easier than had been expected, reported Thomas, and connections had been made with Arpanet in the US, as well as with the Science Research Council's SRC-Net and what remained of British Telecom's experimental EPSS.

The decision to adopt the emerging international standards had been a key element in SWURCC's development strategy.

## New company offers no-keyboard input

by Keith Jones

HOSTILE environments and command and control systems are two of the big potential application areas for the touch sensitive terminal launched by Touch Technology, a new firm owned 50/50 by Mellorata of Colchester and Pulse Train Technology of Esher, Surrey.

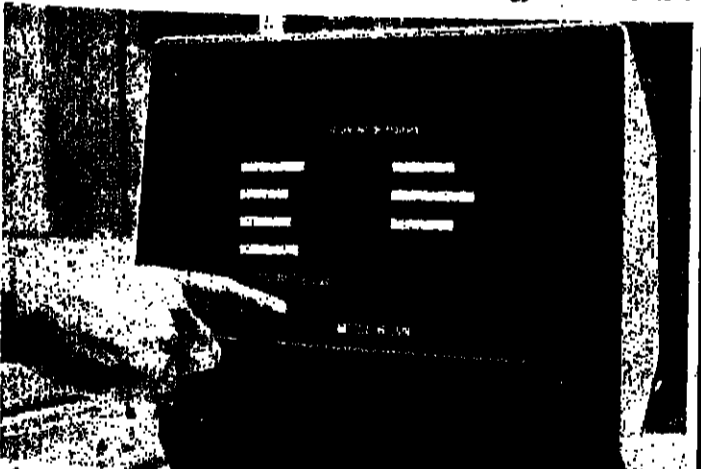

Pulse Train's boss, Alan Hendrickson, one-time managing director of the CRC Group, has acquired the manufacturing rights to the touch sensitive technology employed in the terminal from the Carroll Manufacturing Corp of Champagne, Illinois. Carroll developed it in conjunction with the University of Illinois which still holds the patents.

The term "touch" sensitive is something of a misnomer because the technology involves rows of infrared light emitters and receivers positioned around the rim of the screen. They generate X and

Y co-ordinates when horizontal and vertical beams are broken by the operator's finger or some other pointing implement. A microprocessor in the terminal encodes the information as ASCII characters and transmits to the host computer.

Pulse Train is collaborating with Mellorata mainly because the Colchester firm is the UK distributor for Datamedia, US manufacturer of the Model 3025A terminal which Carroll designed the infrared assemblies to fit. But Pulse Train says that it can also provide touch capability for other terminals on a special quotation basis.

The terminal is seen as being particularly well suited to applications involving naive users or requiring faster and more accurate input than via a keyboard. It will be demonstrated on March 18/19 at the Berners Hotel in London and interested parties should contact Margaret Finch at Pulse Train Technology on Esher 66218.

The Touch Technology touch sensitive terminal.

## Burroughs

● From front page

tion is intended for use in the stated Bendix policy of acquiring high technology companies.

Burroughs, which recently announced much reduced profits of \$11.9 million for 1980, from \$304 million in 1979, is currently capitalised at over \$2 billion. This would imply that a merger and not a bid was in the offing.

However, sources in the US feel that the conflict of interest situation, is genuine, particularly in view of the very strict rules applied to conflict of interest situations by American Securities and Exchange Commission.

Burroughs in Detroit said that they had no reason to believe Bendix was in the process of making a bid. No negotiations of any kind were or had taken place, the company said.

## Freeze raid

● From front page

Oxford as one of the additional distributors appointed by ECS and said that Telecomputing planned to take legal action to stop Hytec from importing kit from ECS.

"According to Martin Hodson the main driving force behind the ECS actions is its major shareholder, the DLJ Capital Corp. It told Hodson that it would not like the funds Telecomputing was acquiring from its legal settlement with ICL (see page 2) to be used to buy shares in "any other" company."

Hodson said that Telecomputing was currently seeking to acquire the 300,000 shares in ECS founded by Michael Roberts, through ECS Holdings. These shares, together with Telecomputing's existing 100,000, would amount to about 50% of the stock in the US firm.

Roberts founded ECS and transferred manufacturing to California in 1980 with funding from US interests, including DLJ.

# Colourful business

by Rory Johnston

BUSINESS presentations will be able to include colour graphical representation of financial results and other statistics from computer, using an instant-development film to be introduced within a year by Polaroid. The 8-inch by 10-inch sheets of film are inserted into a Calcomp 31 recorder, which optically duplicates a colour CRT image onto the film.

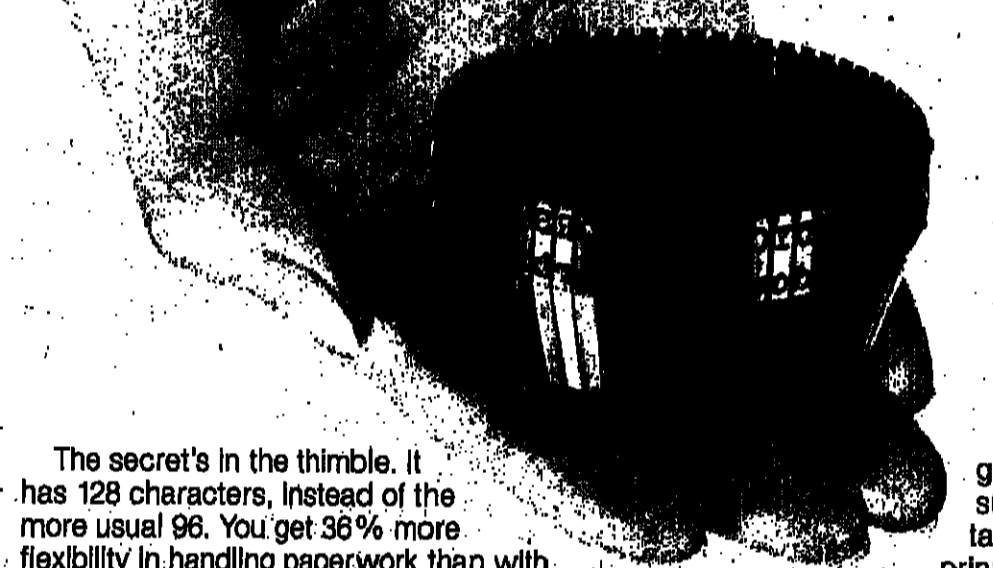

Exposure and development take about two minutes, producing a transparency ready to go on to a projector. Instant colour pictures on paper can also be produced from graphics terminals.

Polaroid is also developing an extremely fast film for recording oscilloscope images so quick that the human eye cannot possibly see them. Exposure times can be in the order of nanoseconds.

A prototype colour transparency film for overhead projection.

# You have every reason in the world to switch to NEC's "thimble" printers. There are 128 of them.

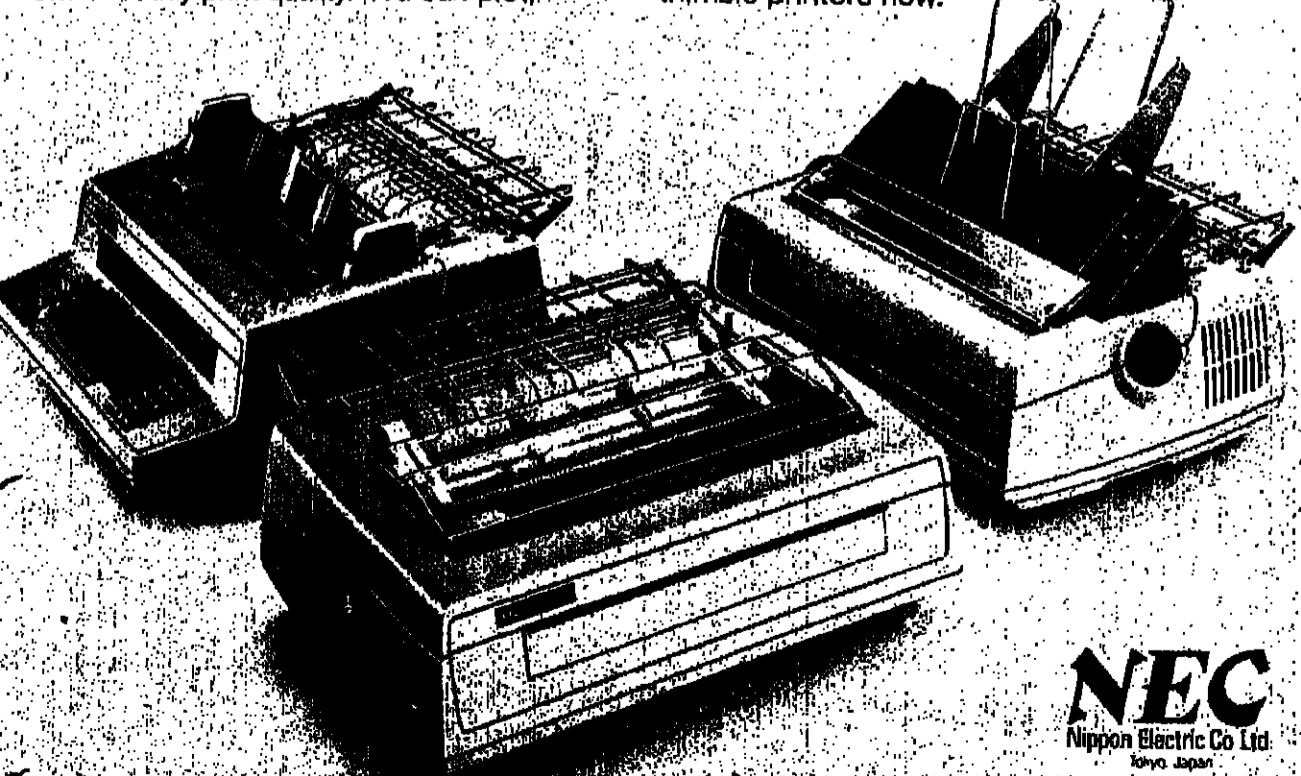

The secret's in the thimble. It has 128 characters. Instead of the more usual 96. You get 36% more flexibility in handling paperwork than with most of the daisy-wheel and golf-ball print elements of other printers. In English, French, German, Scandinavian, name it. And one thimble will last more than 30 million clear impressions. Quietly, quickly.

And that's just for openers. Thanks to our own LSI and microprocessor technology, the NEC Spinwriter Series 5500, which comes in three models, gives you camera-ready print quality. You can plot,

graph, superscript, subscript. Tab horizontally or vertically. And print bidirectionally.

Changing thimbles and ribbons is a snap. Also, system modularity means your Series 5500 printer will grow as your requirements grow. And one of the nicest things about it all is that it really won't cost you a thing to switch. 7 interface capabilities, including those for Diablo, QUME and Centronics, means the NEC Spinwriter is ready to work in your system right away. Get close to our thimble printers now.

## AT THE CENTRE OF EUROPE'S BIGGEST & CONCENTRATED COMPUTER MARKET

# COMPEC EUROPE '81

CENTRE INTERNATIONAL ROGIER, BRUSSELS, May 5-7, 1981.

Europe's leading showcase for minicomputers, peripherals, terminals and microprocessors attracted nearly 6,500 trade buyers to the 1980 event. Visitors came from 15 countries worldwide with the majority consisting of directors, managers, data processing managers, systems managers, systems analysts, programmers, technicians, buyers, engineers and consultants.

Compec Europe '81 is sponsored by the world's leading computers publications COMPUTER WEEKLY, SYSTEMS INTERNATIONAL, DATA PROCESSING and PRACTICAL COMPUTING with support from the leading Dutch publication COMPUTABLE.

Already the demand for stand space is outstanding. Ensure your participation in this prestigious event which serves the fastest growing sectors of the computer market.

# Those damned Norwegians!

Always first. The first to put a high-performance 16-bit computer on one card; the first to create an interactive, multi-user operating system on a mini-computer; the first to implement on a mini-computer a database management system that conforms to CODASYL recommendations; and the first to make many more breakthroughs in the application of modern technology to data processing. That's Norsk Data.

Norsk Data has always been a highly innovative company, designing and manufacturing computer systems for the individual European user. We know that to provide the advanced products demanded by this exacting market, we need the very best people.

And over the last thirteen years we attracted many such people. Because at Norsk Data they work in an exciting, creative environment. They are highly qualified, highly experienced, highly motivated, and they produce high quality products incorporating an impressive number of technical firsts. Because computers are made by people and not by organisations, we invest heavily in our staff; we recognize and reward initiative and hard work.

The computer company with the best people produces the best computers. And we believe we have the best people.

## The competitive European Computer Company

### SOFTWARE FILE

## Products users can tailor to suit themselves

"I'm not sure exactly what I want, but I know that this isn't quite it" sums up a problem familiar to users, particularly first-time users, as well as the people who try to supply them with packages or tailored software.

The unusual thing about the systems supplied by Contour Computer Services is that while certain features such as communications are bespoke and specialised, the basic business packages are adaptable. Once the user has become familiar with the package and begun to spot those small but expensive alterations which would make it fit his business so much better, he can tailor it himself.

"Someone has to have a conception of a system in the first place, and that person will decide on a certain profile, format, and results in the design. That provides the profile of a package but not everyone would agree with the parameters, so eventually the user will end up paying exorbitant amounts to have stuff changed to fit his ideas", said Contour manager Keith Salmon.

"Constantly I get businessmen coming to me who have been told they can't have this and they can't have that. They don't know their bits and bytes, and they don't really want to get involved in the technical stuff, but they do know their own businesses."

Salmon continued: "We tell them they can have whatever they want on their system. I won't accept that you've got to put up with certain things. The business world isn't like that. A computer is a computer, not an accounting machine, a word processor, a calculator, data communications tool, or a memo pad, but if I want all those functions on a microcomputer I'll find a way to do it."

Contour buys in whatever it can, and makes what it can't, providing specialised systems with real time features or communications "bolted on". The company sees itself as the Harrods of the CPM and MP/M market place, supplying any reasonable request, inners and fibre optics included.

The ISB Insta-system of adaptable packages was written by Contour of North London, and Contour discovered it when looking for a standard estate agents package.

"I've used the idea of report generators parameterised by programming, and although there have been lots of attempts to provide skeletal programs, databases, flexible systems which can be bent to user's requirements, most of them; like IBM's RPG and ICL's NICOL are so complicated,

they're really languages," said Salmon. "I was amazed to find it all on a micro."

Peter Crozier, managing director of Computersense, believes the main problem of the burgeoning micro industry is the servicing and support of machines and software which become obsolescent too quickly. He has found a new, more demanding breed of end users as a result of the explosion of microcomputing into the small business market.

"They expect to be able to change the jargon, even the end language, or access files in another system. What we do is supply a basic package, doing all the normal things, but it works with tables, so that parameterised values in any language can be changed or added. The beauty of it is that the customer can do it himself, and the unique thing is that it works."

Led through the system by menus, the user can change field values and make temporary and permanent alterations to the reports without changing any of the Basic coding.

Using the Insta-system "self-service tailoring" feature, one customer built a cost centre analysis program in 1 1/2 days, working on a payroll which needed 250 parameters for each employee. "With highly unionised payrolls, personnel departments sometimes want an enormous number of fields and parameters; they can have as many as they want, and change them as often as they want without calling on professional programming help," said Crozier.

"The important thing with any system is that it should be open to change, and compatible with future requirements."

Computersense avoids using such terms as database, or relational, and does not think of the packages as being in the same field as program generators or development tools. However, the features provided in the Insta-system modules are designed to the same end as such generalised tools, namely flexibility.

Although the packages cater for a general market with accounting, sales, and inventory modules, Contour sees potential in attacking specific markets such as solicitors and estate agents. To get the message across, Contour is staging one-day exhibitions, an idea borrowed from office equipment firm Adler, at which potential users can inspect the systems.

Each module costs £575, and all Insta-system programs work under CP/M on Z80-based machines. Users include Dan Air, Letraser and Augustus Barnett.

## Triad launches manager

A PORTABLE Codasy database which can manage several independent databases within the same system has been launched by Triad. The Multiple Database Management System runs on VAX-11 under VMS, PDP-11 under RSX-11M, and ICL 1900 under George 34.

It offers two levels of data independence, which means that

databases can be extended without affecting application programs or the data already stored.

MDMS was developed by Triad for engineers and scientists at the Royal Aircraft Establishment, Farnborough, where the database is also used for handling administrative data.

The price of an MDMS licence is in the range £15,000 to £25,000.

## Mini system

US systems house Informatica, best known for its mainframe products such as Tame IV, released to the UK and Europe, has its first application from its new minicomputer application products division. It is a version of the General Ledger and Financial Reporting system for the IBM System 34, to be followed by Hewlett-Packard, Wang, Prime and other versions. First buyers outside the US is Shell.

## Xenix for Logica

SYSTEMS house Logica has signed an exclusive agreement with Microsoft in the US for European marketing rights to the Xenix operating systems on Digital Equipment PDP-11 minicomputers. Microsoft's Xenix is based on version 7 Unix; the Bell Labs time sharing operating system.

Logica is already selling the system (on PDP 11/23 and 11/24 machines) as a complete package.

Users try out Computersense packages at one of Contour's one-day exhibitions.

## A user's eye view of self-service packages

ONE user of the payroll module from the Insta-system is Dan Air, which previously used a bureau service for its 2,500 employees.

"The payroll bureau gave us very good service for several years but we have so many different payments to make to our employees that we had to do an awful lot of filling in of forms, for

factors like overtime. It sometimes amounted to 6,000 lines of input, which was an enormous effort with only two people running it," explained Bernard Smith, Dan Air's payroll manager.

"Insta-pay not only provided us with the means of doing the job, but made it easier and

cheaper. About 1,500 of our employees are on pay scales, which means that different groups get rises each month.

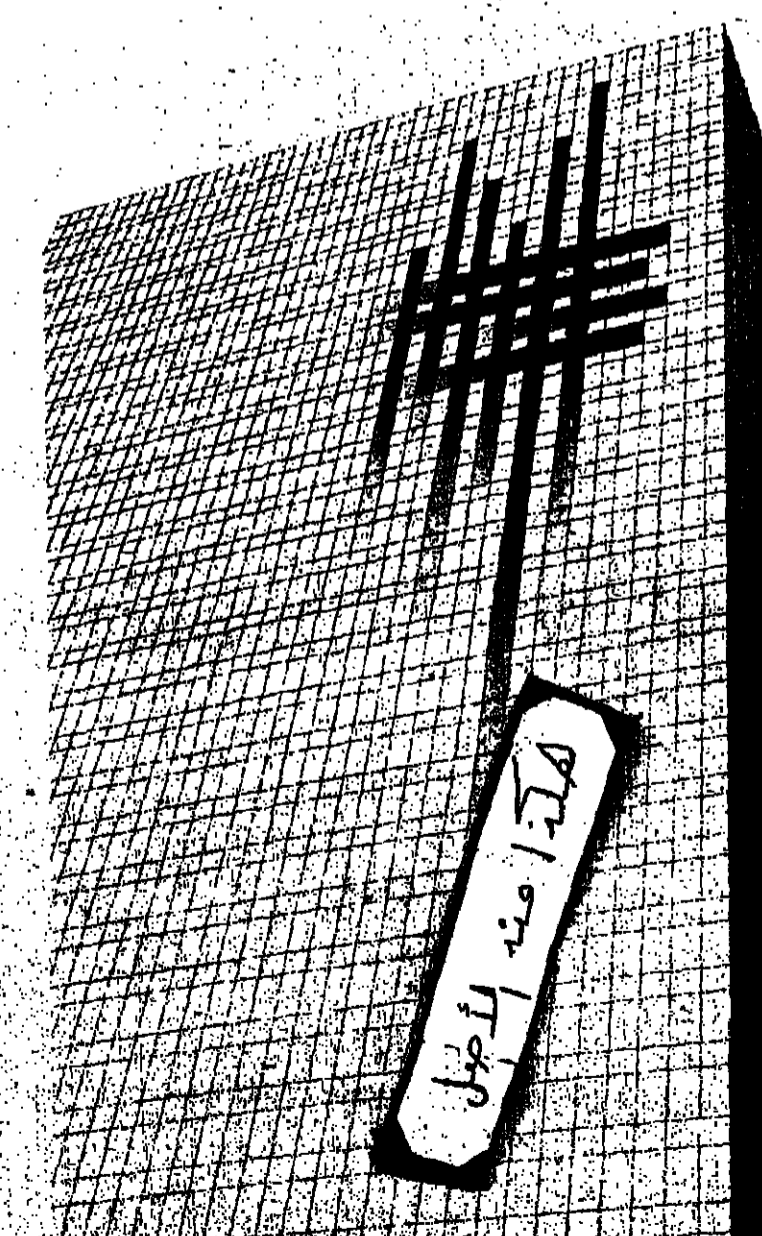

"The amendments that used to take three days, now take two minutes as we've built everything into Insta-pay so that updates are done automatically.

"Doing what we're doing needs a methodical mind, and average intelligence. It totally de-skills the exercise of programming.

"The whole thing is run by two clerks who know nothing about computers but know quite a lot about the way we run our payroll."

# LCN BSN

## ...these stand for the computer system of the future.

Two newly defined and rapidly developing forms of computer technology are emerging:-

LOCAL COMPUTER NETWORKS (LCN)  
BACK-END STORAGE NETWORKS (BSN)

These two developments will be the keys to computing and communications in the 1980s, involving the pooling and sharing of storage and systems resources, including large data bases.

The NESTAR CLUSTER/ONE MODEL is a practical, cost effective implementation of an LCN, using proven hardware, Apple microcomputers and dual floppy disks or 14" Winchester disks for the BSN.

A number of these systems have already been in operation for one year.

Zynar is the European business partner of Nestar Systems Inc.

# The TOTAL Answer HAMILTON

Starting out alone: the first in a series on how to set up your own firm

# So you think you'd like to run your own company?

THE Budget on March 10 is expected to contain further measures, in addition to those announced last year, aimed at helping small companies to start up and grow.

Small business has been recognised as a "good thing" for some time. So over the next few weeks we shall be looking at the problems and opportunities facing someone wishing to go it alone - setting up a company, getting finance, and coping with expansion.

**"Leaving the womb"**  
The majority of people in this country work for large or small

institutions where much of the burden of administration is carried out by the parent organisation's bureaucracy.

The first question most people will need to ask is whether they want to face, by themselves, the whole range of tasks, from dealing with the taxman to paying the phone bill, carried out by their current employer?

The most recent statistics available, for 1979, show that 133,971 new businesses were started that year. A large number of those new businesses were people starting up on their own and, comparatively,

not many were failing. In that year 3,902 businesses were wound up, less than 3% of those starting (the figures don't show how many companies simply ceased to trade).

So, having decided that life outside the corporate womb is possible, what next? First you must ask yourself whether you can survive without the weekly pay packet or monthly pay check, and bound up with that question must be another: Will the business you are starting to provide enough money to enable you to live after you have paid all your additional expenses - and they will be many?

To answer the second question - which you should do in outline before proceeding to estimate the financing requirements of the business itself - you need to set up a simple "cash flow" statement. All this means is that you put your expenses on one line and your income on another. By subtracting your expenses from your estimated income you will quickly see whether you are viable or not - at the very least you will see what you have to achieve by way of income to become viable.

**"Ready to go"**  
Within the computer industry there are four basic business streams.

The first is that of producer of either software or hardware. The second is the marketing and selling of basic industry products. The third is servicing the industry, including things like employment agencies and so on. The fourth stream is self-employment as programmer, engineer, or analyst. There are many other ways of operating in the industry, but most forms of business relate to one of these four streams.

The chances are that you will have a good idea which of the streams you want to start in because you already work in one of these areas.

The last of the streams, the contract employment market, offers the fastest route to self-employment and for many acts as a route by which they generate enough capital to start the actual business. But the same initial question will face a person starting out on the contract path: How do I

establish myself legally so that my liabilities for tax and for the operations of the business are minimised?

There are a variety of ways to "incorporate" yourself to achieve the best result. The commonest methods of incorporation are as sole trader and as a limited company. Briefly, as a sole trader your assets, your house and everything you own can be lost if your business gets into difficulties. As a limited company you can separate your personal finances from those of the business and your personal assets cannot be held for it.

To get the best advice on which option to select - and there are several other ways of setting yourself up besides those mentioned - you will need an accountant. But bear in mind that the accountant's advice will be as good as the information you can give him. So, before going to an accountant, map out for yourself an elementary business plan stating your business and financial objectives. In the case of a software producer such a plan might contain details of when you expect to produce your first package, take on your own machine, hire additional staff. Don't confuse the issue with technical jargon; and don't be too prolix, as the Americans put it (that means don't be verbose).

In practice, your accountant will be able to help you with all the legalities surrounding the setting up of a company or partnership. Initially you should not need to consult a solicitor, but setting up is a good moment either to brush up your acquaintance with your family solicitor, or to put your name on the books of one.

If you have decided to work through a company you will retain the right to pay yourself as a self-employed person, thus avoiding the weekly or monthly problems of PAYE accounting which confuse even the professionals and can involve up to 22 bits of paper.

Before going on to the topic of how to fund your new enterprise there are a number of points to consider, the first of which is Value Added Tax.

**VAT**  
VAT is a tax you levy on your

customers on behalf of the government. If you register for VAT you can in most cases reclaim, before you pay the government, the VAT you paid yourself. The level of turnover at which you must register for VAT is set, usually in the Chancellor's March Budget, and the point to remember is that you can be back-assessed if you pass the limit in any year of trading.

**Accounts**  
Your accountant will advise you what accounts to keep and you should follow his advice. The basic books you must have are cash books, wages books, day books and ledgers. Be sure to keep your bank books carefully (they can be used as ledger accounts).

**Money**  
Most new enterprises need more money than the founders can provide, just to get off the ground. The normal source of most new business cash is the nearest branch

of your local clearing bank, ie, the Midland, Lloyds, etc. In a later article we will see the various services offered by the banks. Here we will simply say how you lay out a financial flow for your business - the communications device for dealing with a bank, whether you intend to raise a £50 overdraft or to borrow millions.

The table (left) shows the items which might appear in the first cash flow prepared by a new business. It is a simple measure of cost against income over a period of time. Cost will include depreciation, but your accountant should help when you reach the point of wanting to maximise the balance sheet using depreciation to your advantage.

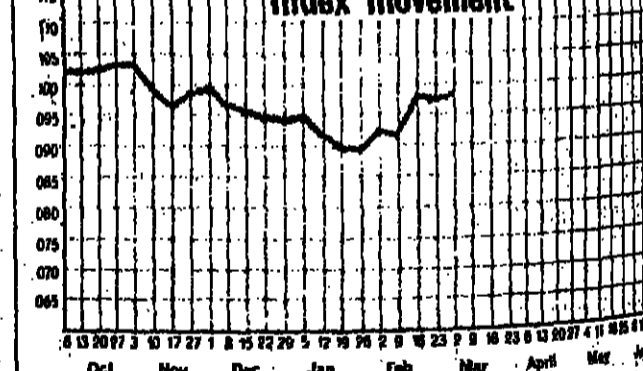

Finally, there are a range of helpful books, quite brief, *What's New*, produced by the Small Firms Division of the Department of Industry. Freephone 0944 in your set.

## COMPANY NEWS - 2

### Data Logic sales leap up 75%

DATA Logic, the London based subsidiary of American giant Raytheon, has revealed a 75% growth of sales for its products. From £11.2 million in 1979, to £19.6 million in 1980.

The figures also reveal that Data Logic had an operating surplus of £1.3 million for the year. The operating surplus in 1979 was £0.7 million.

The revelations by the subsidiary are unusual in the UK, where many overseas companies do as little as possible to display the figures relating to their British operations.

The Raytheon group in the UK includes Cossor Electronics, Badger Engineering and Sterling Cables and Electrical Installations. Data Logic increased the number of employees on its payroll by 200

Managing director Thomas... sees increased opportunities in 1981.

In 1980, bringing the total UK payroll to 700.

Despite the recession the UK managing director, J. Aland Thomas, saw increased opportunities in 1981 for the company's blend of converging technology sales to the word processing and terminal systems market.

### Transaction Security gets £1/2m

TRANSACTION Security, manufacturer of Verisign, the microprocessor-based system for automatic cheque signature verification, has received a £500,000 injection of capital from Technical Development Capital TDC, which is part of Finance for Industry.

The money made available to TSL is to enable the company to pursue its international marketing drive for the Verisign system.

# Computer sectors highest paid despite lack of unions

THE two highest paid sectors of industry for the years 1978/1979 were computer equipment manufacturers, with an average wage of £5,965, followed closely by the computer services industry with an average wage of £5,853.

These figures have emerged in the latest industrial performance analysis figures\* released by the business ratios division of Inter Company Comparisons Ltd.

The compilers of the statistics note that these two sectors of industry "do not have high union density", a factor which the compilers felt might have contributed to higher than average earnings in other sectors.

They noted that IBM successfully beat off an attempt to unionise the company during the period covered by the statistics.

Among the top 200 companies in the UK in terms of return on total assets employed, LCA Computer Services came tenth with a return of 69.7% on total assets employed (RTA). There were 10 computer companies among the

remaining 190 companies, and such well-known organisations as Knight Computer Services (27th, 48.8% RTA), Seicon (43rd, 45.5% RTA) and Data Logic (62nd, 41.5% RTA) appear high on the list of outstanding performers.

In further tables the computer equipment manufacturing sector came fifth in the sector league in terms of return on capital employed. The return on capital for the sector was 29.6%, only 4.4% behind periodical publishers which scored top place with 34%.

Electronic component manufacturing was 10th in the league with a return on capital of 25.9%, and electronic equipment manufacturing came 15th with a 23.3%. Down the list in 64th place with a return on capital of 13.7% was the telecommunications sector.

In the services sector, computer services came sixth with a return on capital of 29.1%, against employment agencies which came top with 64.1%.

The computer and electronic

sectors show up well in terms of exports as a percentage of total sales. Computer manufacturers in this country exported 33% of their total sales; electronic equipment manufacturers 31.7%. Telecommunications was reasonably well represented with 19% of total sales exported.

The comparison on average remuneration showed that computer equipment manufacturers were the highest paying employers overall, with the computer services industry second. Telecommunications came out in the lower half of the manufacturing industry league table with average remuneration of £3,878 per employee.

This may be because telecommunications includes the Post Office which has a large clerical and manual labour force. Nearly bottom of the league were electronic component manufacturers, who paid an average yearly wage of £2,675.

The survey goes on to look at the year-on-year performance of the various sectors within the in-

dustrial groupings. Within the electronics industry this shows a steady rise in the real size of the computer industry in relation to almost every other industry.

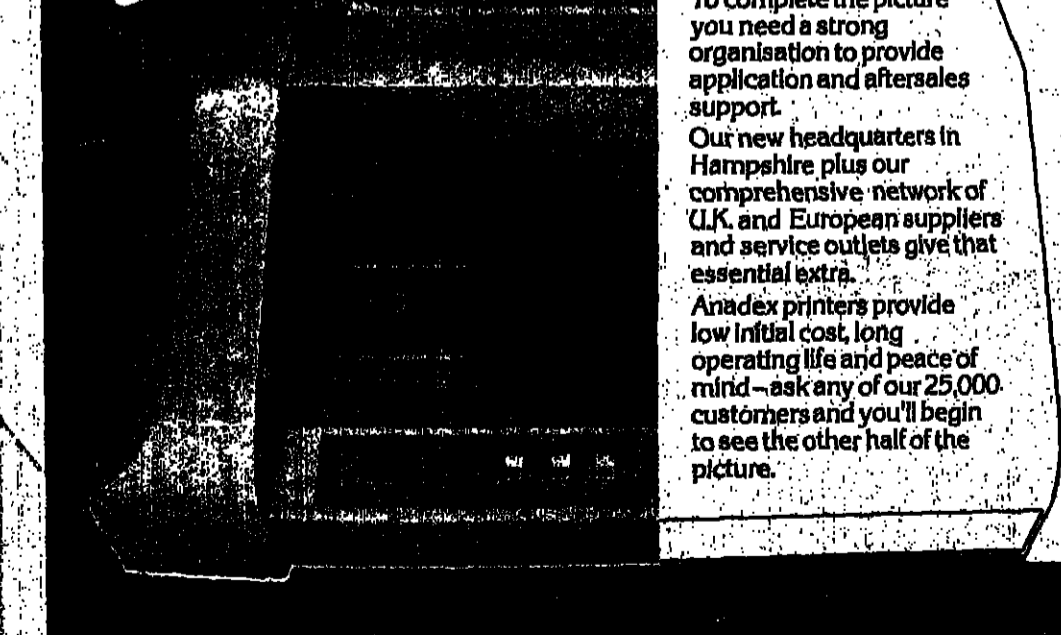

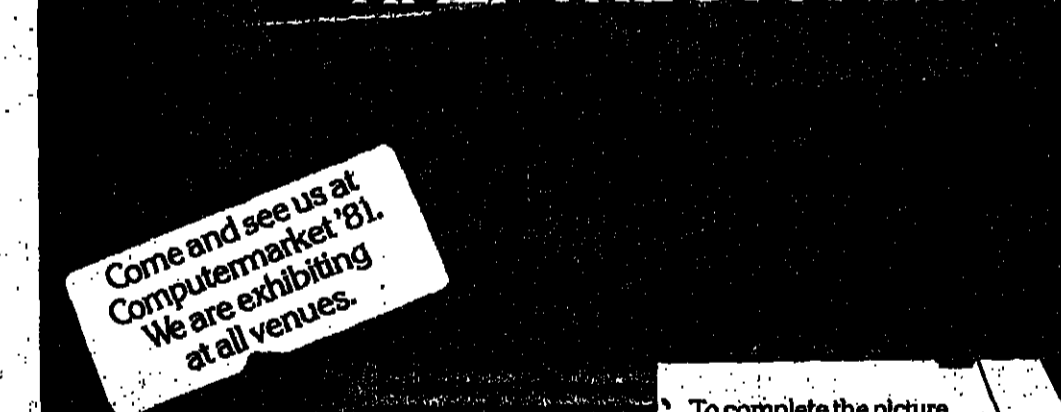

Profitability in computer equipment manufacturing has risen steadily, from 12.3% in 1976/77 to 16.8% for 1978/79. The profit margin on sales has also shown a steady rise, from 9.8% in 1976/77 to 11.8% now. Profit per employee has shown a dramatic jump in the three-year period, from £2,973 to £3,308.

The best overall return on various assets was achieved by the component distributors who moved total profitability from 13.9% in 1976/77 to 20.6% in 1978/79. Profit per employee rose over the period from £13 in 1976/77 to £456 in 1978/79.

In the computer services sector, profit per employee rose from £1,826 in 1976/77 to £3,409 in 1978/79.

\*The survey is available from I.C.C. 81 City Road, London EC1. Price £20.

## MAKING THE RIGHT PRINTER IS ONLY HALF THE STORY...

To complete the picture you need a strong organisation to provide application and after-sales support. Our new headquarters in Hampshire, plus our comprehensive network of UK and European suppliers and service outlets give that essential extra. Anadex printers provide low initial cost, long operating life and peace of mind - ask any of our 25,000 customers and you'll begin to see the other half of the picture.

# Try playing the upside down trick with the objects of thought

"You are old, Father William", the young man said,  
"And your hair has become very white;  
And yet you incessantly stand on your head—  
Do you think, at your age, it is right?"

"In my youth", Father William replied to his son  
"I feared it might injure the brain;  
But now I am perfectly sure I have none,  
Why, I do it again and again".  
Lewis Carroll,  
Alice in Wonderland

IT is doubtful whether Father William's youthful fears were medically justified. On occasion I would come upon my one-time colleague Rod Burstall quietly upended in meditation in a corner of his office. None of us noted any signs of injury to one of computation theory's outstanding brains. If anything, rather the reverse.

Less problematical are the beneficial effects of turning upside down not the agents but the objects of thought. In Douglas Adams' brilliantly perverse Hitchhiker's Guide to the Galaxy, the planet Earth and its human inhabitants turn out to be part of a vast scientific experiment planned and conducted by mice. So blatant an inversion of the accustomed relation between the two species administrators to the brain a bracing shock, but probably no more.

Yet sometimes this kind of shock can and a harmful myth, and even open doors to new truth. This is particularly so when the accustomed relation is between ordinary people and the academic sociologists who conduct experiments upon them.

When the latter are probing the cognitive capacities of children, farmers, tribesmen, factory hands and the like, it is all too easy for the reader to forget to apply the upside-down trick.

The following account is by the USSR's great neuro-psychologist A. R. Luria, who died recently. He relates a dialogue with a villager of Uzbekistan in Soviet Central Asia. The time is 1931-2. Bracketed comments are Luria's. The following syllogism is presented: "In the Far North, where there is snow, all bears are white. Novaya Zemlya is in the Far North and there is always snow there. What colour are the bears there?"

A: "There are different sorts of bears. (Failure to infer from syllogism) The syllogism is repeated."

A: "I don't know. I've seen a black bear. I've never seen any others. Each locality has its own animals: if it's white, they will be white; if it's yellow, they will be yellow." (Appeals only to personal, graphic experience. But what kind of bears are there in Novaya Zemlya?)

A: "We always speak only of what we see: we don't talk about what we haven't seen." (The same.) But what do my words imply? The syllogism is repeated.

A: "... Your words can only be answered by someone who was there, and if a person wasn't there he can't say anything on the basis of his words." (The same.) In the North, where there is always snow, the bears are white; can you gather what kind of bears there are in Novaya Zemlya?

A: "If a man was sixty or eighty, and had seen a white bear and had been told about it, he could be believed, but I've never seen one and hence I can't say. That's my last word. Those who saw can tell and those who didn't see can't say anything!" (At this point a young Uzbek volunteered: "From your words it means that bears there are white.") "Well, what of you, my friend?"

Luria goes on to list what appear to him to be the villager's demonstrated incapacities for theoretical, verbal-logical thinking. The possibility does not occur to him that the peasant was too polite to state bluntly that he was not prepared to accept the major premise (that the bears in the Far North are white) from a young townsman. Luria also overlooks that his subject has (very patiently) been using a perfectly clear syllogistic form of his own.

Major premise: Uzbeks don't talk about what they have not seen.

Minor premise: I, an Uzbek, have never seen a white bear.

Conclusion: I don't talk about white bears.

When there is a purpose in using logic (as in explaining unwilling-

ness to commit oneself on the subject of white bears) the villager commands this intellectual instrument perfectly. His problem resides rather in Luria's apparent inability to follow theoretical, verbal logical reasoning! Yet the Uzbek is expected by the experimenter also to use logic as part of some kind of game, the purposes and rules of which are never put to him. Small wonder if, unaware of this, he concentrates on courteously threading a way past his visitor's obtuse and wooden repetitions.

First he assays a highly hypothetical flight (his "locality theory" of bear colour), only to have it categorised as an "appeal to personal graphic experience". Then he delicately hints that in his world large assertions (such as Luria's major premise) come more fittingly from senior members of the community — Luria was a young man then. Finally he resorts (in vain) to subtle and vivid analogy ("What the cock knows how to do, he does...")

An Uzbek fly on the tavern wall that night overheard this same villager telling about his day.

14 YEARS AGO

From Computer Weekly of March 2, 1967 (this column temporarily replaces our Ten Years Ago feature, due to the postal strike in February and March, 1971, which resulted in the suspension of Computer Weekly distribution):

ICT announced a £580,000 order from the Scottish Gas Board for a 1905F installation, bringing the value of total orders for that fortnight to over £3 million. ... The top UK company in a list of the world's 100 biggest industrial users of computers was ICI, with installations worth £5 million. ... IBM announced a successful process for the manufacture of integrated circuits from germanium with measured switching time of 350 picoseconds — faster than any known silicon circuits. ... The first online real time computer control system for continuous hot strip steel production in Japan was developed by Toshiba. ... A real time compiler for the Coral language was produced by CAP for the Ferranti MF1600 computer. ... Following the merger between Royal Typewriter Co and Imperial Typewriters, production facilities of the Data-log division of Imperial were to be set up in Leicester. ... For the twelfth consecutive year NCR's worldwide revenue from sales, services and equipment rentals showed an increase and established a record. Total revenue for 1966 was \$311,100,000, an increase of around 18% on the previous year.

# Outbreak of rashes on the DP scene

Donald Michie is Professor of Machine Intelligence in the University of Edinburgh.

"A professor of some sort. Knows about bears, or thinks he does. But he was as thick as two planks — couldn't even follow a simple syllogism. Don't know what they teach them these days!" The young Luria went on to make scientific history with what are now classical studies of brain-localisation of cognitive functions. So what they taught them in those days cannot have been all bad, even though it seems not to have included the upside-down trick!

Donald Michie

REFERENCE  
Luria, A. R., *Cognitive Development: its Cultural and Social Foundations*. Translation published by Harvard University Press, 1976.

AT A recently held UK conference on health hazards, the organisers, HUSAT, revealed that they had considered every implication of the impact of computer technology for the past ten years.

It would seem rather surprising that it has taken the authorities so long to discover possible harmful effects of VDU screens.

While experts argue over the question of what is a safe radiation dosage, most DPMs could diagnose the problem with or without tables covering degrees of screen luminance, the number of milliwatts per square centimetre of screen or levels of infra-red radiation generated by the VDU.

As Spots' Paul Fisher suggested (CW, Jan 15), most VDU problems stem directly from tasking demands. This diagnosis covers boredom, fatigue and discomfort from poorly designed seating.

One report indicated a turn for the worse, however, with an apparent outbreak of rashes in the UK and Norway. No doubt the ever-vigilant ASTMS officials are already hard at work imputing the latest rash data.

Only time will tell whether the next report will call for a ban on light pens or photosensitive screens plus a call for the return of the card punch and mag tape encoders.

In fact, the spreading concern over VDU rashes is mild compared to that of a year or so back when concentrated doses of VDU radiation were expected to produce disease, posture strain, eye strain and even blindness.

The industry seems fairly well split with the VDU Eye Test Advisory Group stating firmly that there is no evidence that display units contribute towards eye strain or similar damage.

Balancing this placid report is that of the banking union which suggests that many VDU operators have to make lavish use of valium and florium.

If this is the case, the headaches will be transferred swiftly from the operators to the DPM, as he tries

vainly to discover why workday in relaxed mode.

In any case, it is about time some attention was given to the DPM. Anyone keen to get to grips with some field research on stress, tension, grind, exhaustion and fatigue would find an admirable combination of all factors lying behind the DPM's desk.

A complete research project could be set up with contributions from the computer industry "Gang of Four" — the BCS, C&A, NCC and DPM.

The major problem which will face the team will be that of pinning down the DPM.

Diagnostic testing time would have to be slotted in between the DPM chairing, meeting, public, setting data input and control, marking disputes, mollifying irate users, nursing temperamental system teams and threatening the restive programming section.

Between these tasks the DPM will be rushing off to the last installation hotspots — the air war above the line printer and the temporary operator who is insisting on her rights in respect of the rest-room darts board.

Even when the medical man does catch up with the DPM, it will be unlikely to gain his full attention.

With one eye on his peering files, one hand on the phone and his mind on the forthcoming next meeting with the company accountant, the DPM is unlikely to be able to give his undivided love to the project.

Thermometers used on such occasions will undoubtedly register hefty degree of concern, plus rates will race and eyes will glare. The DPM tries hard to concentrate. Datasab has been busy recently promoting the benefits of switching at the workstation and stress among VDU operators.

The DPM must be excused any ergonomic activity on the grounds that he already gets more than his full share of the action.

# Revolution at a snail's pace

PUNDITS ARE forever telling us that automation will revolutionise the office far more than it has manufacturing. This puzzles many people, in that the word processing revolution seems to be taking an awfully long time to happen. It is, however, perfectly understandable that potential users are hesitant about embracing the new technology when the potential benefits are so hard for the uninitiated to measure.

How much does a word processor increase productivity? The question is not quite as difficult to answer as "How long is a piece of string?", but almost. Any one report on the subject quotes widely-varying productivity improvement figures and then, when different reports are compared, the poor customer probably gives up in despair.

The Central Computer and Telecommunications Agency report in 1979 on the Darlington word processor experiment provoked a storm of protest with its overall conclusion that the machine in question was not cost-effective. The latest report, on stand-alone machines (see page 2), will probably produce a similar reaction even though its conclusions are not so damning.

After Darlington, there were forceful accusations that like was not being compared with like; that the existing automatic typewriter operation was smooth-running and efficient, while the new installation was plagued with hardware problems and failure of training.

Procedures were kept the same with the word processor as with older machines, it was claimed, while new technology necessarily entails new ways of doing things. There have even been doubts expressed about civil servants' skills in work measurement, certainly an arcane subject.

How many of us can pass an educated comment about the relative merits of Treasury Typing Units versus Equivalent Square Inches of Typing? Still, these doubts mean we cannot accept uncritically judgments made by the CCTA such as that which suggests word processors are no faster for initial typing than typewriters.

A consultant will immediately call out "Rubbish! The WP is 11 per cent better!" and prove it. Never mind that another consultant will promptly say 15 per cent.

The civil servants are hampered in their task by ever-falling prices that make cost-effectiveness judgments difficult. They claim that their relatively low productivity increases stem partly from the fact that their operations are already very efficient.

Yet after all this work they have not come to grips with the really interesting questions, such as how shared logic compares with stand-alone? Whose machine is the best? Sadly, there is no getting round the adage: *Caveat emptor*.

# Budget day

BUDGET day, alas, is not Christmas day and neither is Mrs Thatcher Santa Claus. On that basis there seems little point in assembling a list of computer company goodies which should be in the Chancellor's speech next Tuesday. Suffice it is to say that, in the inimitable words of Peter Sellers in his film *Being There* (slightly paraphrased), "plants which aren't cared for and watered don't grow".

Let's talk in her terms, and instead of asking for the interventionist Mrs Thatcher finds so abhorrent simply inquire if she won't create the financial and industrial environment in which this relatively infant industry can flourish.

The computer industry in this country has generated more than its fair share of good ideas, only to see many of them sold and exploited abroad. A major reason for this export of tacit technology has been the lack of positive reward for the innovative in the form of increased wealth, and a negative incentive in the form of oppressive taxation, says Mrs Thatcher.

But she still has to find a way of keeping her election promises that the wealth-creators will keep a share of the rewards. And that begs the higher issue of how many rewards there are when British industry is contracting around their ears.

1984 and all that...

THIS week's example of the strange things people say about computers was sent in by P. G. Johnson of Tetbury, Gloucestershire. What are Algor, Cobol, and Fortran?

Answers: Translators.

Continued in "Brain of Britain 1981", BBC Radio 4

# Why has software industry shunned the patent system?

IN a recent perspective article in Electronics Weekly much play was made over the substantial part played by patents as one of Britain's big invisible earners. It is particularly unfortunate that the UK software industry does not make as much use as it could of the patent system to protect software products, particularly as one is led to believe that our software profession has an international reputation for innovation.

I am a member of the Law Specialists Group of the BCS, and I should like to hear why the software industry has turned its back in such great numbers on the patent system.

I accept that the patent systems of the world have had great difficulties in accommodating software products, but it is now fairly well accepted in IPR circles at least that although computer programs *per se* are not patentable, adequate patent protection for software inventions can be obtained in the UK and maybe Europe by protecting the software product when operating using the inventive software.

Although this may at first sight not cover infringement by an unlicensed party providing its version of the patent protected software in written, disc or cassette form, the new UK Patent Act includes, at

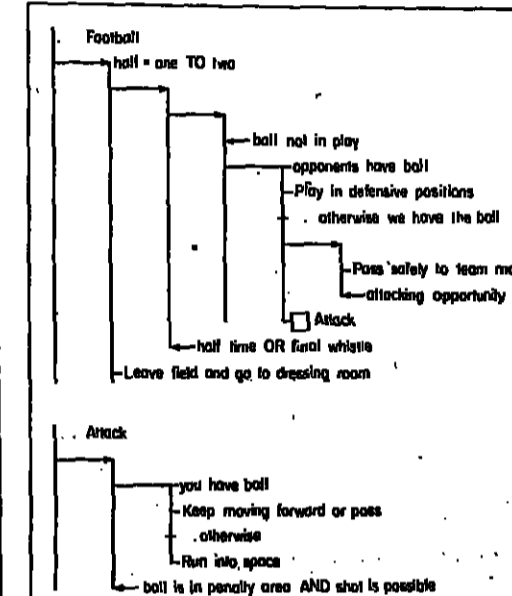

Section 60(2), what is called contributory infringement which can be used effectively to cover that situation.

The Commission of the European Communities is currently interested in hearing whether existing legal protection systems for software are adequate or not and I would like to know why the patent system is shunned by members of the software industry who generate inventive software, so that I can make a meaningful reply to their question.

Liverpool.

# All those boxes are a bind!

The Kidlington computer room. PC Keith Rivers is the one changing the disc pack, and the policeman at the keyboard on the left has recently retired. Site security is tight. Note the closed circuit TV camera and the lack of windows.

## A day on the Thames Valley 'cop op' beat

by Paul Fisher

COP OPS is the tempting, but misleading, tag for the five police constables who look after the Thames Valley Police Honeywell 6025 computer. Their immediate boss, Inspector Brian Squelch, says: "They are operators, but they are more than that. First of all they are database managers."

He went on to explain that database management at this site involves tasks such as calling back records, suggesting and implementing ideas for improvement and checking the quality of the information which is being put into the computer.

Unlike most operators, the police operators have a close understanding of the data being processed. The issue of whether these ops should be involved and knowledgeable about the business beyond the computer room does not arise because they are, above all else, policemen.

"All policemen," says Superintendent Hedges, the man with overall responsibility for the com-

puter, "do some sort of specialised work." Operator PC Keith Rivers adds: "I never see myself as anything but a policeman. We're all policemen here and aware of each other's problems."

They wear uniforms on shift and their grades are set according to police rather than DP structures. A problem that Supt. Hedges faces, common perhaps to many DPMs, is that it is "difficult to give promotional ambition in a small unit."

Full 24-hour cover is given and the ops work to a five-week cycle. One person covers for the night shift which runs between midnight and 8am. The police are well used to working shifts so there is no question of special shift premia.

They are all volunteers and, says Supt. Hedges, "committed to the job. Their expertise is incredible. The PC ops are more important than I am."

As far as skills go, they are mostly self-taught and any formal

training is handled by Inspector Squelch.

Itel is the nickname given to the computer. When the machine was installed the Home Office Honeywell gave some instructions but most of the training was a matter of asking questions and following instructions.

"A lot of it is so repetitive," says one of the PCs, "that we don't need much training. The best is hands on."

He continued: "In my 10 hour shift we only spend on average of two hours actually operating. The rest of the time we're working on database management tasks."

There is no strict division of labour at the site. For Inspector Squelch says: "There is no way I'd refuse to do a job just because of my rank."

How many other ops manage to do the same? "All police work," says Inspector Squelch.

## David aims for his 'spare time' degree within five years

PICTURED in the computer room at Leicester County Council's Univac 1100/10 site is Keith Martin. Apart from being an operator, he is also a student with the Open University, and has just finished his first year of study.

So far he has found the ground he has covered is familiar from his science 'A' levels, and reckons that he has been working "comparatively few hours, perhaps 10 or 15 hours a week."

The pace will quicken now that he has started statistical and computing courses.

An OU degree is as hard to get as a degree from a conventional university, so students are allowed to spread their studies over a number of years. Martin plans to have his degree within five years.

His employers are paying a £98 annual tuition fee. A survey of 38,000 of the OU people who have graduated in the OU reveals that 80% will be had benefited from their education either by better pay or improved skills.

Although a degree is usually required by Leicester County Council to become a programmer, Martin says: "Programming doesn't attract me." He is aiming for a kind of management role.

One of the most successful graduates also works in DP as an analyst. Since 1975 Eddie Taylor from Coventry, has accumulated nine credits in subjects such as linear mathematics, mechanics, applied calculus, quantum mechanics and atomic structure and nuclear computation.

David Martin - OU student.

## Machine that answers back

PERHAPS the ultimate in voice synthesis and recognition will be a system which recognises a typing Frenchman muttering "synthesise".

Trainer 3000 (pictured right) is an American operator training aid billed as a "portable, voice response microcomputer". In fairness it doesn't aspire to the French test. However, Computer Systems Research, the Connecticut company which devised the package, fails to elaborate on whether the system responds to your voice, or you respond to its voice, or both. This last is usually called a conversation.

What's the voice does apparently is to "personalise and humanise the feedback on student responses". I would think the effect would be the opposite. In all likelihood it is a very expensive, bulky, monotonous sounding machine that it is an IT job to teach a machine to respond to a human or a person. But I haven't actually heard the thing.

With the authoritative tone of an operations manager it might sound something like: "Respond to the

It's hard to see where the voice is, but this is the Apple II-based Trainer 3000.

print task after paper change message". When the intimidated student/victim gives up and presses return it calls him names, like clunkhead or knucklehead.

The voice aside, Trainer 3000 is a repackaged Apple II dual floppy disc-based microcomputer with software and course books to teach system operation and problem resolution for IES2/MVS. Courses scheduled for introduction later this year will cover training for SAS1, SAS2, SAS3 and IES2/MVS systems.

It says the students before and after they have completed a question and answer routine and has the benefits of being keyboard oriented.

## Music while you wait

LOVERS of synthetic music who are finding that their waiters have another trick up their sleeve, it's a trick for a good reason. During the night shift at the 616 1 609 662 2070 call centre, the staff play music to the customers with the point of the exercise being to make the waiters more pleasant and to make the waiters more pleasant.

The group came when Satan and his team of code-crunchers "introduced a classic style an informational bureaucracy between machines and problem to be solved, and limited (again) that any link between the two must be via the machine language devised in the 1950s."

## PROGRAMMERS PAGE

# Ops is a good route into the 'closed shop'

AS a follow-up to J. M. Perry's plea for advice on how to break into computing, and my five-pronged attack plan, I have received another suggestion from a DP manager who prefers to remain anonymous.

He writes: "Take a job as an operator or data controller in a small or medium-sized installation, learn all you possibly can about the systems and let the DP manager know you are keen on progressing into programming."

"Most programmers are only too happy to assist operators who show an interest in their work, and demonstration of the ability to solve simple bugs would soon stand the operator in good stead for any programming openings. I write as a DP manager who far prefers to take on a person well-known to me, as a programmer, than one unknown from outside."

Sounds like another feasible approach. But one word of warning: Beware of getting "snuck" in operating (with apologies to Op Squelch). I have heard of disillusioned folk who spent some years trying that route with no marked success.

I think you would have to pick your company very carefully and be quite open about your ambitions from the start. If you were lucky, they too would be as honest and though you might not get the job - many employers prefer stability in a trained op - at least you would not be wasting your time.

Still on the subject of letters comes all you've ever wanted to say about the Boss but never dared to utter - a fairly scathing indictment which I would expect to draw some flak and fortune.

"For the past four years I have been working as well as circum-

stances allow, in a data processing department. In that time I have written programs for five substantial projects, and designed three of them."

"At this instant, only one piece of my code is in use, and it is due to be replaced because the accompanying software is not maintainable. Three of the projects were abandoned without ever being installed, after the programs for them were written and tested and documented."

"To a certain extent I suffer because it is known that I am a good programmer. This department has tackled a series of medium-sized interactive projects and management has given me parts in the most ambitious of them. One was cancelled because a section of it not involving me over-ran its budget. A second was conceived for the 'wrong hardware'. The third was a bench test on a new computer, to check that it will do what it was bought for."

"I designed and wrote the tests and they are running nicely, and two of us were busy estimating the ultimate expected load, when it was decreed that the work should stop. We are now writing more programs when it is not at all certain that the computer can run them."

"The reason for all this confusion is quite simple. Management here knows very little about programming. Our constitution lays down that system designers shall be senior to programmers."

"The place is run by a few people who spent one or two years writing elementary commercial programs, and who then escaped into system design as soon as they could. They are just not competent to run a programming department."

"That would not matter, if they

had adequate programming advice. However, they appoint their own advisers, and their main criterion is not knowledge and ability, but bonhomie."

"They do not deliberately miss ability. They simply do not know what good programming consists of, so they cannot recognise it or its absence. Once a single weak adviser has been appointed to a senior level, he appoints those to the level below him, and the institution is locked in rigid mediocrity."

"Management realise that something is amiss, but they do not know precisely what. Any junior programmer who tries to tell them is regarded as 'difficult', and lacking in bonhomie, so he is ignored."

"I do want to work well, but it is difficult when good programming practice is generally missing and one's own efforts seem to lead nowhere. Is my experience common?"

Anonymous again, though not surprisingly.

Mrs. Steve Shirley, Vice-President (Professional) of the British Computer Society, holds out a welcoming hand to great Kit Aston making his first public appearance as England's Chairman of the International Year of Disabled People at a reception organised by the BCS Committee for the Disabled.

## Dastardly plot by the 'new bureaucracy'

THE editorial columns of Wireless World recently devoted 12 inches of space to "The new bureaucracy".

This conceals a strange attack on computer programmers, who besides being responsible for most of the world's evils (Wireless World's anyway) and establishing a stranglehold on computing from 1940 to 1980, are confusingly described as: glamorous, twice, and "very well paid; to say the least, from the beginning".

Strap on your seat belts for the main gist of this editorial, which takes off like a Beethoven adventure. The nub of the argument is that programmers, ignorant of both the problem to be solved and the technology to do it, have become all-powerful enough to stop any change in computer architecture.

This has been fixed for 36 years, since 1944, and now the wicked programmers have insisted that it is copied without improvement into today's microprocessors.

Going on from strength to strength, they "developed" a glamorous view of themselves, made threats into the media, and took no interest in the paying customer, who meanwhile was clamouring for a mechanical solution to his problems (knowing, of course, exactly what he wanted).

Take a deep breath, we haven't grounded yet. The group came when Satan and his team of code-crunchers "introduced a classic style an informational bureaucracy between machines and problem to be solved, and limited (again) that any link between the two must be via the machine language devised in the 1950s."

Has WW never heard of supply and demand, or is that a little too modern? The demand for an interface between man and machine necessitates a programming language, and leading to supply of a new skill, programming, to handle the language. Not the paranoically opposite view of an exclusive sect of programmers devising secret codes to keep out the world.

I hardly think, either, that we can thank the programmers for introducing to society the concept of "information processing", as is imputed. I feel some small recognition is due to the roles of psychology and engineering, and the research studies undertaken into the subject under both banners.

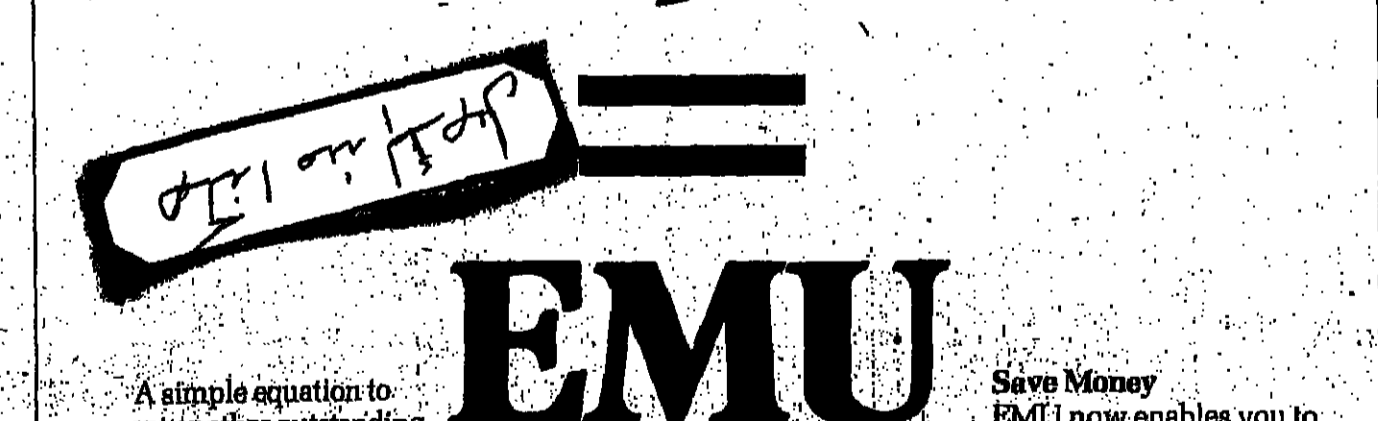

The point to all this high flying comes of course in the last paragraph of the editorial. A Minister of Information Technology is to be set up, and the WW cry is that this will merely institutionalise "the new bureaucracy". It ends with a rather poignant appeal to the "technically uneducated, parasitic bureaucracy" variously called information technology or computer science, to leave poor old electronic engineering alone so that it can get on and solve all the world's problems.

## PUZZLER

THE integer 12 has the following property: X (the original number) plus the sum of the digits making up X, equals Y. Y, plus the sum of the digits making up Y, equals Z. And Z has the same digits as X, but in reverse order.

Does any other integer of two or more digits have this property? See page 47 for the answer.

# PDP 11/34A<sup>®</sup> × 8

A simple equation to present another outstanding development by Systime, for use in DEC systems.

The Extended Memory Unit enables your PDP 11/34A<sup>®</sup> or series 5000 processor to increase its memory up to eight fold, by being configured with up to two megabytes of MOS memory. The unit is now available at factory-build stage for new processor orders or as a field attachment to existing installations.

Improve Performance on Loaded Systems

If you are running RSTS V7, RSX11M 3.2, or RT11 on

your PDP 11/34 then it's highly likely that additional memory capacity will improve its performance. Up to 50% more terminals may be serviced by the system, without response time degradation; and in some cases a 100% increase has been achieved in trials.

Your user programs and procedures are completely unchanged.

**SYSTIME**  
Goncourse Computer Centre  
432 Dewsbury Road, Leeds LS11 7DF  
Tel: 0532 702211

Save Money  
EMU now enables you to considerably upgrade memory capability without having to change to another processor.

Very simple, and very economical.

\*PDP 11/34A is a Registered Trade Mark of Digital Equipment Corporation.

I like the sound of EMU's equation for increasing my memory capability. Please tell me more.

# Normalisation, or the relational approach

THIS article will be dealing with the technique of normalisation. Normalisation is also known by the name of the relational approach, and originated from the work of E. F. Codd of IBM's research laboratory in San Jose.

The objective of normalisation is to obtain the highest level of data independence possible, or to put it another way: to ensure that any one entity has only one value for an associated attribute type and to ensure that each associated attribute type is describing the entity type in question, and not another, i.e. that it is not the identifier or the property of another entity type.

These two objectives should be familiar, as they are the same rules used in entity analysis.

The purpose of normalisation is to ensure that the work of updating, creating, retrieving and deleting attribute values is kept to a minimum, whether the effort is that of the computer or the user. It should also ensure that data is not lost because of artificial dependencies introduced into it, i.e. the resulting structures should be robust and consistent.

The building block of the relational approach is a relation (not to be confused with a relationship).

A relation is represented by a rectangular table of data values. Each column represents all the different values of an attribute type in the relation, each row all the values of the attribute types which are in some way related, for example, by belonging to the same entity type. However, at this stage the relationship is not known.

The rows and columns are given special names in the relational approach. A row is termed a *tuple* and in our example the row would be termed an 8-tuple because there are 8 columns. The columns are called *domains*, thus all the values under the Operation Time column form this domain; the attribute type "Operation Time".

(These terms make no difference to the way in which normalisation is achieved, but it is useful to know their meaning since they are used by the proponents of relational databases.)

In Figure 1 an example of a relation is shown. We have used a report which was being produced for the hospital administrators. It was called the Doctors' Operating

Schedule, and showed which doctors were scheduled to be present and/or perform at operations. It is unnormalised, because it cannot be represented by a pure and consistent data structure.

Certain rules governing the relation must have been followed before normalisation can proceed.

- Each attribute type must only occur once in the relation as a column heading.
- Each value of an attribute type must be consistent in its format and the attribute type name must be such that it does describe the value.

For example, it would be wrong to have operation date values of 02/80 and 03/02/80 under the same column heading and also wrong to have just "Date" as a column heading describing both dates of admission and dates of operations.

These points are usually taken care of by the fact that the forms, reports, etc., are usually structured in this way already.

The steps to normalisation are as follows: first, an identifier of the tuples must be found. Each attribute value (or group of attribute values) is examined to see if it (or they) identifies a tuple, and once the value (or values) is identified, the corresponding attribute type (or types) is underlined in the table. In our example, doctor number and operation number uniquely identify each tuple in our relation.

Next, remove repeating groups — the doctor number and doctor name are repeated within the relation (the report may in fact have omitted them, but the implication is that they would have been repeated in still there).

The original relation is split into two, so that the repeating group only occurs once, and a new key is chosen to identify each tuple in the new relations.

In Figure 2 a relation with doctor number as a key has been created and a relation with a key of doctor number and operation number. The data is now said to be in *first normal form*.

Third, ensure that the values of the attribute types are fully dependent on all the key attribute type values. Several questions can be asked to determine this:

- (a) If the complete key is changed, is the attribute value changed, i.e. amended or deleted, etc.

## Section I — Part 20

of our series describing a system design methodology

by Rosemary Rock-Evans

which attribute types are affected? (b) If I change only part of the key i.e. each attribute type value making up the key, which attribute type values are affected?

The values in the Figure are intended to be used in deciding these points.

For example, if I change or delete Operation Number BA1598/040280/1030 it looks from the values as though I would have to change the operation time and date, the patient name and the date of admission. All information on Operation LP1654/150280/1300 is erroneously lost if I delete doctor 13855.

The relations are again split so that all the attributes are dependent on the key items. The result is as shown in Figure 3, which is said to be in *second normal form*. Note we have found no attribute values dependent on the full doctor number/operation number key. The resultant Operation relation contains no duplicated rows as removed as part of the process of normalising to 2NF.

Finally, remove all attribute type values "transitively" dependent on other attribute type values. Again, the data values are intended to show where "transitive dependence" occurs. From Figure 3 it appears that the date of admission is dependent on the patient name because repeating groups of values occur. The attribute types which are related are removed from the relation and one chosen to identify the resulting tuples.

In Figure 4 the resulting relations are shown. Patient name has been chosen to identify the tuples which have been related.

The relations are now said to be in *third normal form*. Fourth and fifth normal forms have been invented by people other than E. F. Codd, but these two forms place a very high reliance on an interpretation of the patterns of the data values. This may be seen, coincidence, and it is for this reason that they have not been discussed in this article.

It is possible to convert the relations into an entity model using the following steps (see Figure 5): place the relations with the fewest keys at the top of the page; where a key occurs at two levels replace the lower level key by an entity box and a line representing an entity relationship; where an attribute type occurs on one relation and an attribute value on another, place it by a 1:1 relationship.

These relations can be converted to a model, and similarly the model can be converted back to relations (this will have some bearing if implementation is being planned using a relational database).

This article has concentrated on normalisation as a technique which can be used to verify entity analysis. CACI does not use normalisation in isolation to produce entity models and determine attribute types. In the company's methodology it is used to reveal any erroneous relationships between attributes of an entity type that have been missed, determine which attribute types could be used as keys (if these are not known) and check and verify that the model includes all entity types and all necessary relationship types.

Since it is a widely used technique, it is important to understand the limitations of the approach. The disadvantages of normalisation are as follows:

- a) It is impossible to identify an entity type from a relation unless a possible identifier is present, or only one attribute type of the entity type (its key, say) is present.
- b) A basic understanding of the attribute types must have been gained before normalisation can take place. Although normalisation is supposed to rely on data values, it is dangerous to assume that information can be deduced using the data values alone without any knowledge of the entity types or attribute types. If normalisation is used with no knowledge of the business, sheer coincidence can result in completely erroneous results.
- c) The types of information generally used for normalisation e.g. reports, forms, existing computer record contents, can give misleading information about the entity types and relationship types in a business. A report is, after all, a combination of data extracted from knowledge of entity types and relationship types. The extraction process need not necessarily maintain the original structure.
- d) However much normalisation an analyst does, there are some relationships and entity types which never appear. This is because the reports and forms, etc., are again the limiting factors.

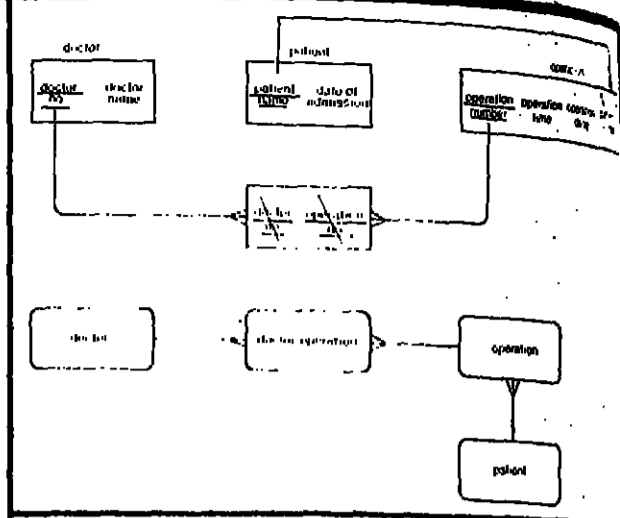

Figure 5. Converting to an entity model.

Normalisation can be a consuming task. It is better used for verification, rather than the main analysis tool, simply because so many redundant relationships types can be lost which then have to be eliminated. In other words, much more effort is required for normalisation than for entity analysis to give the results.

The advantages of normalisation are:

- a) It is a mathematical step-by-step approach for people who find it comfortable using mathematical based methods for analysis. Note the point made above, reliance can never be placed on normalisation alone.
- b) It is useful as a checking verification tool.
- c) It may provide information, say, possible keys which may be available from any other relation. In Part 21 we will start to discuss some of the application design considerations affecting the system for implementation.

The Data Analysis methodology was developed at CACI by Palmer.

## Storage names management team

FOLLOWING its absorption of line printer manufacturer Documentation, Storage Technology has named a management team. Managing director is Colin Cook who has been with Storage for two years and previously spent five years with Memorex. The former managing director of Documentation, Rod Sear, is now with Newbury Laboratories.

Marketing manager is Terry Rolfe. Before joining the company he was in the RAF and then held sales appointments with IBM and Documentation. Norman Howarth joined Storage in 1978 from BASF. He helped to set up the Swiss subsidiary and then headed the European technical support group before joining the UK company in April last year. He is now UK field engineering manager.

Manager of systems engineering services is Clive James. He joined Storage two years ago from Calor, and spent six years with Centre-File. Martin Ral, a chartered accountant previously with Documentation, joins the company as financial controller. Marketing manager is another ex-Documentation man, Joseph O'Baldeston. He spent most of his time at Documentation in European training, going on to become field engineering manager and eventually transferring to marketing. Ged Toes is UK field operations manager. He spent 12 years with Univac before joining Documentation.

## COMPUTASTARS Entries shower in

"THIS is one problem that I welcome." In these delighted words, Computastars and Computastars organisers Gordon Cairns, described his initial reaction to the last-minute rush of entries which poured avalanche-style into his office last week.

"There are between 120-130 teams entered for Computastars and 10 entrants for our fledgling Computastars event," an overworked but obviously exultant Cairns explained earlier this week.

Commodore will supply hardware and BSO will provide software for the heats, UK final at Birmingham on July 26 and the European final which will be held either at Nijmegen or Utrecht in Holland," Cairns added.

"With word processors and a whole range of Commodore equipment to hand, organising the event and collating results will be a relatively straightforward matter compared to previous years."

## ICL appoints software research director

A DIRECTOR has been appointed at ICL, to take responsibility for engineering and software research, design and development in the company's Product Development Group. He is Alan Bagshaw, a founder managing director of International Computing Services Ltd.

Bagshaw's career in the computer industry started in 1956 when he became head of computing services in the Ferranti Computing Research Group. Following the merger with ICL in 1963, he managed the ICT computer services division, going on to become managing director at International Computing Services.

When ICL formed in 1968, Bagshaw returned to the parent company to take up senior appointments in product planning design and development. He has subsequently served as director of systems integration.

The new appointment does not involve any changes to the ICL main board.

**An engineering scholarship** NEWCASTLE University has awarded this year's R. W. Mann Scholarship to Alan Ramsshaw, a first year mature student in the Department of Electrical and Electronic Engineering. The scholarship is awarded annually to first year engineering students, to encourage those showing promise in making a successful career in their chosen field.

It takes the form of a grant of up to £1,000, subject to the amount that a student is allowed to receive without reduction of his or her Local Education Authority Award.

Ramsshaw worked for a television rentals company after leaving school, while studying for the City & Guilds examinations in radio and television servicing. He went on to take 'A' levels in maths and physics, his grade A passes securing him a place at Newcastle University.

He hopes to become a professional chartered engineer, involved in research and development of microprocessors in industrial applications.

**Prime expands in Europe** FOR the second time in a month, Prime Computer has appointed two European vice-presidents. The new appointments are Pierre Grouvel, vice-president of European Southern region, and Roger Parsons who takes responsibility for European Northern region. Last month, Peter Geynes was made VP of Prime's European marketing operations and David Cheesman became VP of research, development and engineering outside the US.

Grouvel joined Prime four years ago as managing director of Prime France. Before that he was head of the French data systems division of Xerox. Parsons joined Prime six years ago, starting as sales executive and working his way up to managing director.

## AIDS FOR INDUSTRY

The North West Industrial Development Association (NORWIDA) has prepared a 95 page document detailing sources of financial and other assistance available to industry and commerce in North West England.

This publication has been produced as part of NORWIDA's programme to promote the region as an attractive location for industrial and commercial enterprises.

Aids for industry is sectionalised under the following headings:

- No. 1 — Government Incentives for Regional Development.
- No. 2 — Government Assistance for Manufacturing, High Technology, Science and Research Based Industries.
- No. 3 — Government Assistance to Non-Manufacturing Industries.
- No. 4 — Company Taxation and Allowances.
- No. 5 — Special Assistance for Small Firms.
- No. 6 — Employment and Training Schemes.
- No. 7 — Assistance from Local Authorities.
- No. 8 — Financial Assistance from EEC Sources.
- No. 9 — Energy Conservation Incentives.
- No. 10 — Exporting.

The complete document is available from NORWIDA at a cost of £5.00 (inc p&p) or individual titles can be purchased at 50p per section.

North West Industrial Development Association, Brazenose House, Brazenose Street, Manchester M2 5AZ. Tel: 061-834 6778.

Please send me Section No. ☐ I enclose my cheque for £ ☐ Please invoice my company. ☐ Please send the general information on NORWIDA services. Name  Address

## MANAGING YOUR BUSINESS GUIDES

- \* Tax and VAT £5.00
- \* Employees, Health and Safety
- \* Selling, Importing and Exporting
- \* Starting a Healthy Business

This is an impressive new series of guides, packed with invaluable information for the interested business owner or manager of both large and small concerns. Written by a panel of 22 authors, all experts in their own fields, each book is a carefully researched and up-to-date information on the latest trends and techniques.

Published by The Hamlyn Group, Avonmore House, 14, Brompton Road, London W14 9BR.

ORDER YOUR COPIES NOW! Fill in this coupon and send it to: Dept. JB-7, The Hamlyn Group, Avonmore House, 14, Brompton Road, London W14 9BR.

Please send me POST FREE: ☐ Tax and VAT £5.00 ☐ Employees, Health and Safety £5.00 ☐ Selling, Importing and Exporting £5.00 ☐ Starting a Healthy Business £5.00

Enclosed is a cheque/P.O. for £

If I am not completely satisfied I may return the books for a full refund within 14 days of delivery, and you will refund my money.

The intelligence gathering system used by the Thames Valley Police is unlike any other. Exclusive report by Paul Fisher

# Controversial system is 'helping the police with their inquiries'

SINCE 1976 the Thames Valley Police, TVP, has been operating an intelligence-collating computer network based at its headquarters in Kidlington. Dubbed the Collator Project, it is the only system of its kind in the country and, from its inception, has been controversial.

The controversy has focused on the kind of information being gathered and the uses to which it is put.

A national plan to extend similar systems, containing intelligence as well as matters of record, was dropped at the beginning of 1979. Ken Oxford, chief constable of Merseyside, said at the time that the TVP system had "inherent dangers".

When approached by Computer Weekly, the TVP was swift to grant an interview. At the conclusion of the first interview, the TVP insisted on a list of questions. These were answered by a written statement which is quoted here in full (in italics).

The statement was made, with Home Office vetting, by the TVP's assistant chief constable of management services, Joe Emery, and was followed by a further interview and a visit to the computer room.

The statement has seven headings: History of the Project, Purpose of the Experiment, Progress, Funding, Future, Information on the Computer, and Safeguards.

**History of the project.**  
1. The need to store information coming into the possession of police has developed since the formation of

the modern Police Service during the last century. This information, which has become known as crime intelligence, has two major objectives:

(a) The protection of the public by means of the prevention of criminality, and  
(b) the detection of offenders against the peace.

2. The advent of unit beat policing, which was intended to help police operate on a neighbourhood basis, together with improved personal communications, led to more information being stored in police stations. Such information was filed and recorded manually on cards and was difficult to link together. Manual systems of storage are difficult to cross-reference which in time makes the information difficult to retrieve and therefore largely inaccessible to many operational police officers.

3. An initial, but limited, experiment in computerising collator's records was carried out in one police station in the Thames Valley and this led to an extended experiment throughout the Force, and the development of the system as it is today.

Emery is anxious to place the Collator Project in an historical perspective. He believes that changes in police methods are reflections of changes which have taken place in society at large and he stresses that increased mobility, both of the general population and among police officers, has inevitably produced a less intimate form of policing than existed in the past.

As in the rest of the country, he

reckons that one third of the Thames Valley's 1.8 million population moves house once every five years. Police officers, too, now move from one part of the country to another. (There is a Scottish PC computer operator at Kidlington.)

From the police point of view, a major result of the motorway system is that criminals are more mobile and therefore harder to trace.

The police now deal with a greater bulk of information from more diffuse sources. Information and intelligence which was previously stored in policemen's heads is now, of necessity, say senior officers, filed. "The TVP," says Emery, "is doing electronically what has been done for the past 150 years."

In 1966 one of the effects of unit beat policing was the establishment of a formal record-keeping system. It involved the appointment of a local intelligence officer, LIO, with a brief to build up files of names, addresses, criminal records, incidents and vehicles.

**Police intelligence is now forward looking... and because it is so powerful, it is frequently libellous.**

Elsewhere in the UK's 51 other police forces, the LIOs create manual filing systems. In May 1972, before the TVP's computer had been introduced although it had been mooted, the Police Review carried a report which voiced certain reservations.

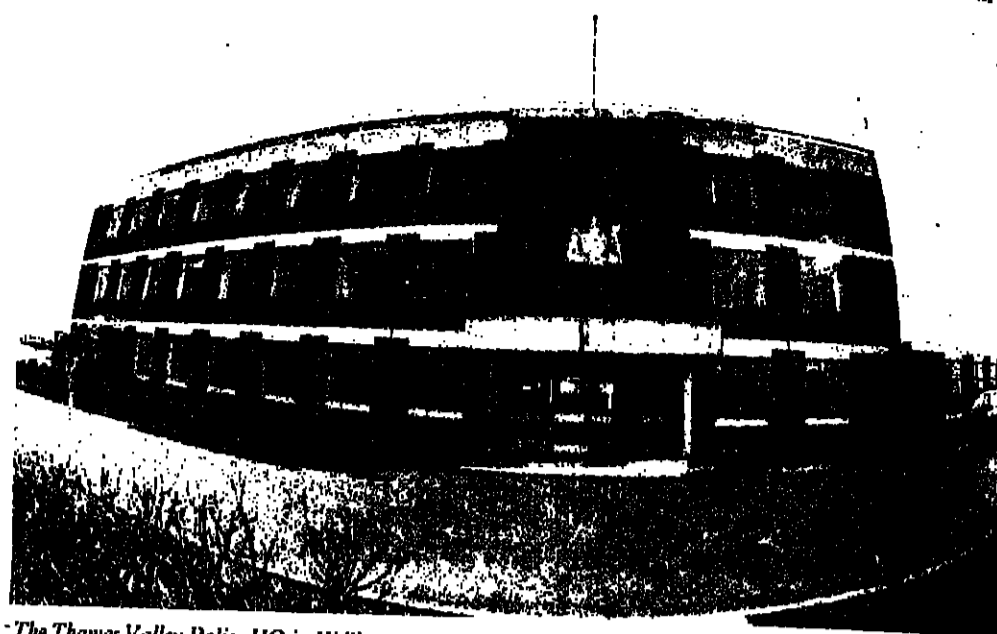

"Since 1966 the Service has collators in most Police divisions and they have amassed information which in both quantity and quality would surprise most people on their books."

"Police Intelligence is now forward looking, anticipating who is going to commit what, when, and where and because it is so powerful it is frequently libellous. Much of the information stored in collators' files is tinged with the calculated guesswork of the officer who has provided it. Much of the information is personal detail and it may seem a trespass on the freedom of the individual."

However, the principle of intelligence gathering is as old as the principle of policing itself. It is the method of storage and retrieval which is controversial.

More controversial still is the use of a computer for the prevention of criminality and it is in this area that the police are attracting fierce criticism. Intelligence, which can be used to prevent crime is also a potential threat to individual privacy.

Journalist Duncan Campbell, campaigner against threats to individual rights, writing in Volume 2 of the book *Policing the Police* contends that the preventive system of policing represents a sinister shift. "The emphasis," writes Campbell, "in investigation has changed from evidence gathering after the commission of crime to intelligence gathering in advance of any particular crime being committed."

The Thames Valley Police HQ in Kidlington.

Emery would certainly not concede that intelligence gathering is sinister. Rather, he would see it as part of a policeman's duty. "We are paid," he says, "to prevent crime and catch criminals."

At present it is entirely a matter for the police to identify potential criminals without any statutory or other external guidelines. Every individual has the potential to be a criminal, so the issue devolves into who has what details stored on them within the computer. Those questions were not fully answered when put by Computer Weekly.

Campbell says: "The present drift to speculative intelligence gathering, in which any citizen, however innocent, is regarded as fit subject for surveillance because of what he may do in the future, must be stopped."

Emery likes to talk of practicalities and by way of an example he pointed out of his office window and said: "If we were told that the British Legion was likely to be broken into tonight, and this is the kind of information we do get, you'd expect us to do something, wouldn't you?"

**Purpose of the experiment**

4. The current project is an experiment being conducted jointly by the Home Office and the Thames Valley Police. The objectives are to see if:

(a) it is practicable and efficient to put on to a computer information collected by police collators, and  
(b) judgments can be made of the relative value of differing types of criminal information collected.

The police very quickly made plain their relationship to the Home Office: "It's not our experi-

ment, it's a joint experiment with the Home Office. Our agreement is that the TVP does not release anything without their approval."

The hardware and network serve over 3,000 policemen who cover the 2,200 square miles of Oxfordshire, Berkshire and Buckinghamshire. Of the 32 terminals, nine are at Kidlington for development and training and the others are distributed in 19 police stations throughout the area.

The Honeywell kit was purchased by the Home Office for £500,000 and installed in September 1975. There have been two upgrades from the original 6025 processor to the current 192K 6060. The system is linked into the main power supply and has a pair of Datamat 305 front end processors. There are five 100-megabyte hard disc drives, one of which is removable. These are journalised on to tape every 24 hours.

The policemen I spoke to seem happy with the system. Superintendent George Hedges, who has overall responsibility for day-to-day running, was unenthusiastic, he says, "technically unable" to elaborate on faults, but he did concede that "communications need rationalising."

Although still officially considered an experiment, the project is live and it is relied upon to a considerable degree. A measure of the system's value to the TVP is in the number of occasions it is accessed. In an average week there are 300

indirect retrievals, 3,000 direct retrievals and 8,000 card access from a police force number 3,000.

An indirect retrieval is made on the basis of very limited information, such as the first three letters of a car number-plate. With direct access there are fuller details which are produced by the computer and stored in a room next door.

Emery appears in little doubt to the experiment's value. It is unable to say whether a large number of crooks had been caught but did say: "It has been a very useful tool."

He went on to say: "It has enormous potential although it is too early to be specific. We are correlating and assessing criminal intelligence. I'm a user, not a technician, and it is hard to evaluate results, but the task it does would be impossible to do manually. If you have a computer, intelligence tends to stand in isolation."

**Progress**

5. The first objectives (practicality) has been achieved, in that information is being input and retrieved by authorised officers. Those officers authorised to create and delete data are few, and their work is carefully monitored at Force Headquarters. Information can only be retrieved by password holders who are limited in number and can afterwards be identified. The second objective (value of information), although on-going, has been achieved and the first aim of evaluating this material is expanding the future.

The project has largely freed itself of outside technical support. The resident manager from the Home Office's Scientific Development Branch left the site in 1979. Hedges, who can be regarded as DPM although he does not regard himself as such, has been with the project for years. Apart from a recently appointed Cobol programmer and the visiting Honeywell expert, all key staff are from TVP ranks.

"If we aggregated to computer professionals," says Hedges, "we wouldn't be in our interests. The project needs a police view and police thought, and if it didn't have there would be a danger of losing integrity within the Force."

The policemen volunteered for their DP roles and none came with any DP experience. Nonetheless, Hedges is concerned that individual officers could become "technically too important," pointing that the nature of modern policing demands that "all policemen do some sort of specialised work. He is fortunate in his prime for the five police constable operators who between them provide round-the-clock coverage. "They are very important to me," he says.

The man near the computer with a pivotal role is Inspector Brian Squelch. He is a kind of operations manager, and in charge of training and the preparation of instructional and guidance bulletins.

His job, as the general LIO, is to monitor what the other 19 officers put into the system. Of the LIOs in the outlying police stations, only a sergeant and a

remaining 25 are constables. Along with some 30 officers in specialist units, they are the only people with the authority to create, update and delete information. Indication of such authority is contained within the password these officers are issued.

There are a further 350 lower level password holders who are able to access the system from the terminals but not to create, update or delete.

The passwords are known only to Squelch and to the holder and when typed into the terminal do not appear on the screen. The maximum length of the passwords is 15 letters, which is an increase to thwart those who would peer over the holder's shoulder as he keys his secret word to the screen.

Passwords can be used to determine security levels, although this

facility has been left untapped. As an additional security measure, the first message to appear on the screen is the last time that the password was used.

Much store is set by the passwords, as can also be seen at the conclusion of the TVP's statement.

**Funding**

6. The experiment has been funded by the Home Office in relation to the purchase and maintenance of the computer, and the provision of technical staff, and by the Thames Valley Police Authority in the provision of a computer hall and operating staff. Further funding will depend on the decision concerning the future of the system.

So far, the Home Office has footed the major part of the bill. A sum of £700,000 has been requested by the TVP from central police funds. This is for computing in general, and apart from the Collator Project includes proposed expenditure on: fleet management, personnel records, stores, firearms and shotguns, police housing records, uniform issue, criminal records, crime reports, wireless equipment and resource deployment.

An additional £70,000 has been set aside to cover maintenance costs should the system be allowed to continue when the Home Office pulls out next October. By then, reports by Hedges and an external one detailed below, will have determined the future of the project.

**Future**

7. A report on the evaluation of the experiment is being prepared jointly by the Home Office and Thames Valley Police. It will be in the light of this evaluation that the final decision concerning the future of the project will be made. That decision will be made by a police committee comprising members of the Police Authority, the Thames Valley Police and the Home Office. That committee will also consider the report of a Probabilities Committee over the last two years, which has been considering the future computer needs of the Force in many other administrative and operational fields.

The appointment of the civilian programmer would suggest that the project has a future. If it is retained, Hedges reckons that the Honeywell kit "should be in use for the next two or three years". The police authority chairman, Ron Clibborn, said last November when the external committee was set up: "I think it is sensible to appoint the working party and let them see what should be done."

Both the committee's and Hedges' reports will be presented in May.

It would seem that Emery is willing to publicise the project, as he has recently responded to a request by the Sunday Times by inviting them to Kidlington. Perhaps it is in anticipation of the reports. He commended a Sunday Times Insight report from July 2, 1978, as being a fair piece of reporting.

**Information on the computer**

8. The information going on to the computer is no different to that which has been kept in paper records in Police Forces for many years. Naturally, putting such information on to a computer raises more far-reaching issues, which were carefully considered when the experiment was planned. They will again be considered in the light of the report of the Data Protection Committee, and any legislation that may ensue. The project should help the consideration of the recommendations affecting police dedicated computers because it will provide a more precise analysis of the type of information collected through the collating system and its operational value.

This section of the statement is the closest response to my written question submitted after the preliminary interview: "How many people have details about them recorded on the system and what percentage of those are convicted criminals?" In any statistical sense the question remains unanswered.

"The majority of the information," says Emery, "is on criminals. You have to trust us."

"To my mind," says Squelch, "all the information in there is factual. We don't encourage the input of information for the sake of information. We are simply providing a service for the police. Squelch has prepared the guidelines for evaluating the input, although these remain confidential."

Other than disqualifications, traffic offences are unrecorded. Traffic accidents are also unrecorded unless they involve a criminal or a stolen vehicle. The police say that if five youths were stopped in a car and four of them had no criminal record, the one who did have a record would be the only one to have details of the event recorded.

Two groups of people who are on the system but who are not criminals are "the aggrieved in crime" (that is victims of crime) and missing persons. Hedges denies that the victims are there as a result of a desire to record intelligence willy-nilly, and stated that the purpose was to cope with some 3,000 people were reported missing in the TVP area.

A demonstration search was conducted by Inspector Squelch. Details of an imaginary suspect had been fed into the system so that this demonstration could be given without violating privacy. The imaginary suspect was identified as having a tattoo on his right arm, brown hair, a red or red and white car and being aged between 31 and 36. An indirect retrieval.

The password was keyed in, although it could not be seen on the screen. It was followed by the de-

tails. One of the operators thought that a comparable force-wide search relying on card indexes would take a month.

First to appear on the screen was an indication of response time. The indicators go from A to E, A for a maximum two-minute data recovery time and E for several hours. The demonstration was on a live database on a Friday afternoon and a B level response was indicated. This search resulted in one hit and details of the individual eventually came back after five minutes. Had it been remembered that the imaginary suspect was a gypsy, the response would have been much swifter.

Each of the five police operators is responsible for one of five files for names, vehicles, addresses, occurrences and crime records. After three and a half years the files have reached approximately 50% of their capacity, although the police are aware it is not practicable to fill them completely.

The operators spend as little as a quarter of their shifts actually operating, and give the rest of their time to calling back records, making improvements and generally checking the quality of the LIOs' work. They therefore like to be thought of as database administrators.

The only published figures about what is on the files is in Duncan Campbell's account in *Policing the Police*. Dating back to 1979, they were supplied by the Home Office.

persons: 99,825  
vehicles: 17,156  
addresses: 77,834  
occurrences: 66,998  
crimes: 5,943

Hedges did not want to comment directly on the figures but thought that they were misleading. He estimated some 30% of the people in the system live outside the Thames Valley area.

Squelch also said that many criminals operate under several aliases, which creates distortions. He knows of one criminal with 15 aliases.

The vehicle file is small because it is restricted to suspected users and the Police National Computer, PNC, in Hendon is accessed for other vehicle details. The PNC is

## Police outline 'stringent precautions' taken to protect their database

remaining 25 are constables. Along with some 30 officers in specialist units, they are the only people with the authority to create, update and delete information. Indication of such authority is contained within the password these officers are issued.

Superintendent Hedges: "There is nothing of evidential value in the computer. It's not a method of policing, it's an assistance."

to the courts, to the police authority and to the public at large. They accept that any data legislation should clearly establish accountability and mark the boundaries within which schemes such as the Collator Project should operate. Until this is enshrined in law, everyone concerned pushes ahead in a vacuum.

**Safeguards**

9. The most stringent precautions are taken in the Thames Valley Police Force to safeguard the information in the computer. Firstly, the equipment is housed entirely on police premises. Secondly, it is not linked with any other system. Thirdly, the information held is meant to be relevant to the prevention and detection of crime and not to be concerned with matter that is unrelated or lacking in substance. Fourthly, data can be obtained only by officers who are personally authorised to have access to the computer system: a system of passwords controls access to the computer and, as a further precaution, the data can be structured into different levels of security, with passwords being graded according to the level of security to which holders are permitted to have access. Fifthly, this security system makes the information stored much more secure than unaltered information held on manual systems and computerisation does enable records to be controlled, evaluated and weeded much more effectively.

The final precaution returns to the theme of security. Apart from the passwords and the limited terminal access within the Force, security is provided at a number of other levels. There is a "reluctance pass" information over the air, a fact admission that on occasion information is passed over the air. Herein lies a potential breach of security.

There is a private wire network which Hedges said even individuals from British Telecom or Honeywell would find extremely difficult to crack. It is a transaction-driven system, 40 terminal operators must know their codes, and there is a rule that they must not leave their seats while access to the system is required.

On the file an elaborate procedure of security cards at two doors should ensure that no stranger stumbles in unaware of where he is. The computer room has no windows and is scanned by closed circuit TV. The console area outside the main computer room has windows, but these are covered by sturdy grilles at nightfall.

Hedges is clear on the question of linkage to other police computers. "It has never been interfaced with anything else, not even the PNC. It can't happen." He went on to say that the data is not used for any other purpose than that for which it was intended and cited health and financial records as being more comprehensive and potentially dangerous.

"It's absurd to say that you can't keep criminal intelligence," says Hedges. "There is nothing of evidential value in there. It's not a method of policing, it's an assistance."

Throughout the two interviews there was an insistence that there was nothing "sinister" about the project, an insistence which was not entirely upheld by the refusal to answer directly some of the questions on the exact nature of the intelligence which is being stored.

**EXHIBITION & CONFERENCE**  
**March 11-13,**  
**09.30-18.00 daily**  
**Wembley Conference Centre**  
Exhibition admission £1.00  
A complete study of microprocessors in use. Microsystems '81 consists of a wide ranging exhibition, together with a three day conference and three one-day microprocessor awareness courses. Together they comprise an invaluable opportunity for those interested in microprocessor applications and the latest developments in microelectronics technology. A full advantage of this unique event to examine and discuss a comprehensive range of microprocessors, peripherals, memory products and personal computers together with the software which accompanies them.

For conference details write to: The Conference Administrator, IPC Exhibitions Ltd, Surrey House, 1 Throby Way, Sutton, Surrey SM1 4QQ

For advance exhibition tickets at £1 each, write to: Microsystems Tickets, IPC Exhibitions Ltd, Surrey House, 1 Throby Way, Sutton, Surrey SM1 4QQ

Please note applications for tickets cannot be accepted after February 23, although tickets will be available at the door for £2.00. On Crepes, should be made payable in UK sterling to IPC Business Press Limited

Jep 11.12.81

A combined word and data processing facility based on an Apple II and electric typewriter/printer from Personal Computers Ltd.

Microsystems 81, the fourth event of its kind, is being held at the Wembley Conference Centre between Wednesday, March 11 and Friday, March 13. Last year's exhibition attracted 5,500 visitors and the organisers are expecting an even bigger turnout this year. More than 170 delegates

## MICROSYSTEMS '81

Sponsored by Computer Weekly

are expected for the personal computing conference on the last day. Among the topics

will be a discussion on the problems and pitfalls of going it alone when using personal

computers for business applications. The range of fresh ideas presented in our exhibition preview illustrates the fact that the longer we have the micro, the more we can do with it. The feature is rounded off with a look at the micro's role in networks.

# Low-cost solutions offered to a variety of problems

by Anthea Ballam

IN the midst of the recession, the fourth Microsystems exhibition offers an opportunity for commercial and industrial management to find low-cost solutions to a variety of problems. The choice promises to be wide.

Apart from the familiar proven microsystems products there is an array of new components and peripherals, and a selection of packaged software. The conference provides the theoretical background to this most important area of data processing, while the exhibition offers practical and demon-

strable examples of products ranging from the most sophisticated multi-user network to the humblest floppy diskette.

In addition, there will be stands from publishing and book-selling organisations and representations from the Department of Industry, the City of Bradford Metropolitan Council, and Gwent County Council, all eager to establish their interest in future microcomputer technology developments.

The past year has seen some conspicuous trends in microsystems development. Software possibilities have advanced

significantly with the widespread use of popular operating systems like CP/M and packaged products like Visicalc and Desktop Plan. The advent of Winchester disc storage systems has also made these products even more cost justifiable in a commercial and industrial environment.

For the microcomputer enthusiast, systems from Newbear and Sinclair open up the possibilities of experimentation even with minimal resources.

Followers of the latest technological wizardry will be hurrying to the exhibitors that have promised us new products at this year's show. Many of these will be untried products for the first time, and some have chosen the exhibition for their worldwide debut - like Portable Microsystems with its Scope office computer.

Claimed to be the first portable office computer, Scope houses processor, storage, video and thermal printer in a single unit. Featuring the new standard CP/M operating system, this product is likely to provoke much interest. Portable Microsystems will also be showing the new AL13 acoustic coupler from Sweden, and the Digicass digital cassette recorder for low-cost file storage.

The sophistication of microsystems development will be underlined by Micro Scope of Maidhead which will be demonstrating both new systems and applications. Following an agreement with Burr Brown, Micro Scope will show the 10S 2000 and CS 450 process control and monitoring systems.

Micro Scope sells and supports these products and will also be making the most of its other new stars, Micro Vacs and Micro Para. Micro Vacs is a micro-based accommodation display system that is particularly suitable for use by tourist information centres where its database facility provides an effective filing system on hotels and boarding houses. Micro Para is a flight inventory and accounting system for travel agents.

Another new arrival to the show will be the latest business system from Solid State Technology, the series 8100. This will be featured on the Hawke Electronics stand. Based on multiple 8085 processors, it is capable of expansion to a maximum file storage capacity of 16 megabytes.

Hawke Electronics will also display the Motorola multi-user, multi-tasking Exomacs 16-bit processor alongside products from Texas Instruments and AMC.

Another "first" has been promised to us by INCAA (Industrial Computerised Applications and Automation). This will be the Inco microcomputer which grew out of INCAA's Camac computer. The Burcard based Inco system can be built up to meet users' individual requirements, and the product is made additionally attractive by a choice of interfaces for video terminals and printers, analogue inputs, control circuits for motors and logic controllers.

A status monitor, Anadex, has chosen Microsystems 81 for the launch of its two printing products. The 1222 system systems printer will be highlighted, along with a new 80-column printer that reproduces alphanumeric characters as well as high density graphics. Developed by Advanced Micro

Devices, the System 8 Development System has been built with the latest RTE16/8050 real time emulator support package. Other exhibits will include the System 29 which comes complete with all hardware, software and applications cards included. The exhibitor will also be showing a cross-section of LSI devices including a new range of 16K PROMs.

The familiar face of the computer equipment supplier Tekmar will be seen at the show. The first of a new modular family of development systems, the 859 Microcomputer Development Lab will be on display. This incorporates complete in-circuit emulation and hardware testing capabilities. This product is based on two fundamental components: units for microprocessor development and data management. Hewlett-Packard will be spotlighting two instruments for implementing analysis testing a microprocessor based system. Designated the HP 5001 and 5005A, the first of the two allow signature analysis to be used in troubleshooting on products based on the 6800 microprocessor, as if it has not been originally "signed-in".

The 5005A is the latest feature Multimeter and allows a variety of functions to be used out by a single unit. Hewlett-Packard will also feature its 4000 microprocessor development system.

The show has also been the scene: launch-pac for Scan 2 and Scan 3, two compact microcomputers from the stable of Son Computer Systems. Incorporating a 10 or 20 megabyte Winchester disc drive and a 12 megabyte cartridge tape drive as standard, both units are priced at under £10,000.

From Milton Keynes based brand new business computer known as Oscar. Based on a 6800 CPU, the system is built into a 12-inch screen visual display unit with separate keyboard. It features 800K-bytes of floppy disk storage and comes complete with CP/M and a selection of software.

Also on display will be the latest microprocessor machine designed for academic, industrial and research applications.

A range of functional cards including a simple 5-volt bus system will form part of the Microtech Technology (Microtech) stand. Up-to-the-moment, low-cost development systems will also be featured, based on the 8085 microcomputer, priced at under £2,000.

Full software for this range of systems in the range of 32K and 64K will be discussed on the stand. A clustered multi-system will be demonstrated, based around a single store.

Microcomputers ranging between 32K and 64K will be exhibited by the Black Box III Range. A particular interest will be the model 330 which features a 3 1/2-inch Winchester range unit. This first range unit will be available in April. High resolution colour graphics and sound generating capabilities are just some of the features available with Data Applications personal computer system.

## MICROSYSTEMS PREVIEW - 2

# Plenty of fresh ideas at the Wembley exhibition

Applications industrial microcomputer modules will also be featured.

Personal Computers Limited (PCL) will be showing a low-cost answer to the problems of words and data processing. The UK's largest Apple dealer will be showing a self-correcting daisywheel typewriter that will also function equally effectively as a printer interfaced to the Apple microcomputer. This new product allows a systems buyer to acquire a combined word and data processing system for under £3,000, including word processing software.

PCL will also be demonstrating a new sophisticated financial modelling package, designated Micromodeller.

A return visit to Microsystems will be staged by the Digital Equipment Corp. This year one model in the VT100 video terminal range will be demonstrated. This unit allows users to construct a microcomputer in a table-top unit. The increasingly powerful LSI-11/23 will be shown alongside the ubiquitous PDP-11 minicomputer.

From the Wiltshire based Cifer Systems comes a broad selection of visual display units. Among its products to star will be a highly intelligent terminal, the 2684, which is user programmable and based on a dual 280 microprocessor. It also features built-in floppy disc storage.

Yet another to use the exhibition as a launching pad will be Britannia Computers, which will be revealing a new range of UK designed and built computers.

The Microword complete Business System incorporates a 64K processor, not to mention a comprehensive software library covering a host of financial and accounting programs as well as word processing. The new Britannia 363 business computer costs about £7,300 and functions as a combined data and word processing system.

From the Bracknell division of Ferranti Computer Systems comes the F100-L microprocessor development system. Based on Ferranti's 16-bit single chip microprocessor, the F100-L incorporates a complete set of hardware and software facilities to allow user programs to be tested and developed with ease.

A range of new EPROM programmers and emulators from GP Industrial Electronics will get their first UK airing at the exhibition. The system 4000 series is suitable for a variety of roles, from the opening software design with in-circuit EPROM emulation through to production programming.

A new operating system from Interface Computer Services has been designed to enhance the capabilities of any 280 or 280A based microcomputers that run under CP/M. Interface will also feature the Dinabyte microcomputer and the Wabash range of floppy discs.

A new operating system from Interface Computer Services has been designed to enhance the capabilities of any 280 or 280A based microcomputers that run under CP/M. Interface will also feature the Dinabyte microcomputer and the Wabash range of floppy discs.

A new dot matrix printer, Oscar from Interactive Data Systems will make its debut at the show.

A family of standard software modules has been produced to complement Vector International's single Eurocard microcomputer range. The Eurocard series has also been extended by the addition of a 32K dynamic RAM and GPIB interface cards.

On the Transdata stand we will be able to see the CX500 microcomputers. At the bottom end of the league is the CX502 single-user system with floppy discs. At the top end Transdata offers the CX504 multi-user system of hard disc and cartridge tape back-up.

A multi-user, multi-processor networking microsystem will constitute part of Equinox Computer Systems' display. This will be shown with the newly announced Equinox 200 cartridge disc based microcomputer.

Bristol based Wilkes Computing will demonstrate its Gemini systems, which are capable of both data and word processing applications. Ideal for smaller commercial organisations the systems, prices from £9,000, are supported by a variety of financial and accounting software.

One of the newest brainchildren of Research Machines of Oxford will be displayed at Microsystems 81. This will be a 40/80 character VDU board that allows operation of software switches between modes. The board also features a user definable character set of 128 characters, smooth scrolling and screen windowing. Full software support is offered in a choice of languages.

Suitable for both scientific and commercial applications, Midleton's two general purpose computer systems are based on DEC's LSI-11/23 processor. Other items on the stand will be the Superbrain intelligent terminals.

Peripherals will also form part of the Software Sciences display. The company will highlight its 30/22 integrated terminal, a standalone device for point-of-sale-type applications. This will be shown with the 9050 Datalogger and a selection of Eurocards.

Forming a part of the Unitech group of companies, Celdis Microsystems will make the most of its Data General product display. Of particular interest is the DG MPT version 100, a 16-bit MicroNova. It is as much at home functioning as a microcomputer as when operating as an intelligent terminal.

Development systems and microprocessor support equipment from a choice of manufacturers can be seen on the Crellon Microsystems stand. A selection of OEM computer boards will be shown alongside two industry standard NMOS microprocessor families from Motorola and Zilog.

An extensive range of modules for the 6800 microprocessor has been promised by RCS Microsystems of Feltham. The series incorporates ROM and RAM

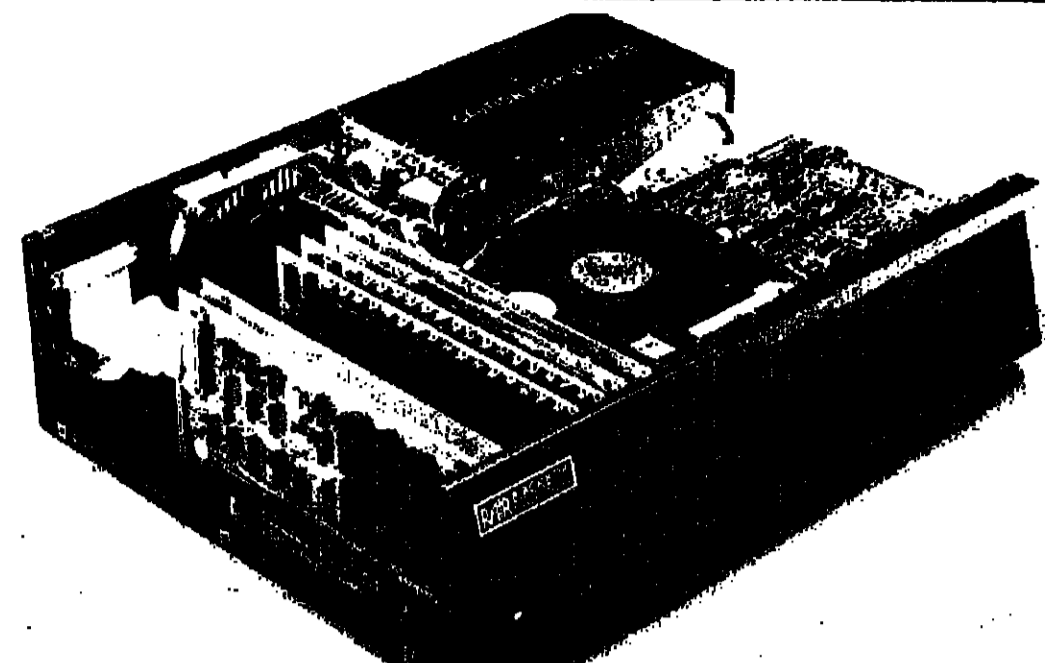

and a choice of I/O options including parallel, serial and A-D. All modules are compatible with the Exoriser bus allowing for easier software development.

A selection of component products will feature on the Technitron stand including ProLog Prom programming equipment, Z80 and 8085 emulators and MicroLink ROM simulators.

From the stable of Sinclair Research comes the widely publicised ZX80 personal computer. Priced at just £80 in kit form, this small system is available with a choice of accessories for the enterprising data processing enthusiast.

Small computers and books will feature on the Newbear Computing Store stand. Here visitors will be able to see the Sharp MZ-80K computer alongside a thoroughly comprehensive range of microcomputing book titles.

Books on computing will be available on a number of stands at Microsystems 81. The Computer Bookshop will be represented, as will Dillons University Bookshop.

The Black Box III from Rair features an in-built, 5 1/4 inch Winchester disc.

ICS Publishing will provide an opportunity to "look-in" on its microcomputer training system. These full-colour video courses are carefully scripted and edited.

Another unusual exhibit will be the Bowthorpe Microsystems display. This stand will be dedicated to the working possibilities

of microprocessor techniques in different applications, varying from mechanical handling and sorting to administrative control.

Design and consultancy services will also be the theme of the Millennium stand. Millennium Professional and Technical Services offers expertise from professional

engineers and programmers to assist in the progress of project work for large developments and also in the selection of systems for the first time user.

Other consultancy service facilities offered at Microsystems 81 will be presented by Phipps Associates of Epsom.

# Microsoft is pleased to announce there will be no 16-bit software crisis.

They didn't realize it at the time, but when Bell Laboratories developed the UNIX® Operating System they solved some mighty weighty problems for 16-bit software development. Now Microsoft is picking up where Bell left off and putting the UNIX Version 7 OS on the Intel 8088, Zilog Z8000 and Motorola 68000. (We've got the PDP-11 version too, at a very reasonable price.) We call it the XENIX™ operating system, pronounced "zenix". Naturally, we are customizing and enhancing the XENIX OS to meet your needs, and we are providing complete support for every customer.

That's great news for the legions of UNIX OS fans, as well as for everyone getting into the 16-bit market. But even better news is that Microsoft can offer XENIX to OEMs at very competitive prices. 16-bit micro and the UNIX OS—that's a powerful combination, and only Microsoft has it. Finally, a state-of-the-art, standard OS.

As the biggest name in microcomputer system software, Microsoft will define the common ground to unite the next decade's microcomputer hardware.

And the XENIX operating system should make life a lot easier for everyone in the business. As the standard operating system, it will eliminate the crises that normally accompany emerging technology: the relearning and retooling needed for each new machine.

The software investments that become outdated the minute hardware diversifies. The wasted efforts.

The XENIX OS (written in the C programming language) will provide long sought-after hardware independence and portability, thus protecting software investments across hardware lines. Switching to a new microprocessor will be easy, since Microsoft will support them all.

Honest-to-goodness UNIX OS. Only better. The UNIX system well deserves the attention it's received in the past decade. It's a highly sophisticated, interactive, multi-user, multi-tasking system, with extensive utilities and accompanying software packages—creating a total working environment. A standard environment.

Actually, the operating system itself is only a small part of the XENIX package. The vast system of utilities, developed over the last 10 years at Bell Laboratories, includes a C compiler, software development tools, journal libraries, games, text formatting and typesetting programs, and much more.

And Microsoft's modifications and enhancements make the XENIX OS even more suitable for general commercial applications. XENIX software will fully utilize the powerful instruction sets and large addressing capability of the 16-bit microprocessors.

As with all Microsoft products, the XENIX system will be customized to your exact needs and specifications, then supported, maintained and updated every step of the way.

In addition, all of Microsoft's already-famous system software (including BASIC, COBOL, Pascal, DBMS), will run on the XENIX operating system. XENIX will also run all existing UNIX Version 7 OS software.

A proven leader in worldwide software standards. Microsoft's role as the leading supplier and authors of microcomputer system software has meant that we've established a number of standards throughout the industry. That's why we're called a leader.

The establishment of a 16-bit standard operating system will be a big step forward for the industry. With the introduction of the XENIX operating system, we're offering a superior standard system, plus the benefit of our extensive knowledge and expertise.

The XENIX operating system. The standard that ends the 16-bit software crisis. Before it's even begun.

\*UNIX is a trademark of Bell Laboratories. PDP-11 is a trademark of Digital Equipment Corporation.

We set the standard.

# OHIO IS NOW IN BERKSHIRE

Which will upset geographers but delight OEM systems designers.

Ohio Scientific, you don't need telling, are one of the largest microcomputer manufacturers in the States.

From our new full-service base in Berks, OS (UK) now supply all the low-priced high-production state-of-the-art value-for-money equipment you need.

Hardware. Software. Pre-tested. Burned-in. Ready-to-go. Backed-to-the-hilt with the sort of quality control and service back-up that made them third largest in five years.

For example, Ohio Scientific's C2-OEM is designed to be the cost effective solution to business and industrial applications which can effectively utilize typical microcomputer execution speed. The C2-OEM benefits from Ohio Scientific's years of volume microcomputer

production experience yielding an extremely competitively priced medium performance microcomputer. The C2-OEM utilizes the popular 8502 microprocessor operated at 1MHz clock speed in conjunction with 48K of 450 NS Dynamic RAM memory.

The C3-D makes the electronics of the popular Challenger III triple processor microcomputer system with the cost effective 8" Winchester disk. The C3-D features the three most popular microprocessors—the 8502A, 88B00 and the Z80A. When operated in the 8502 processor mode, the machine executes instructions approximately twice as fast as competitive microcomputer systems. The C3-D incorporates 52K high speed static RAM, serial I/O port, bootstrap and diagnostic firmware, 8" floppy disk for transport and backup as well as an 8" Winchester. The C3-D comes complete with OS-65U disk operating system which is optimized for use with the Winchester hard disk and includes a fast 9-digit BASIC by Microsoft.

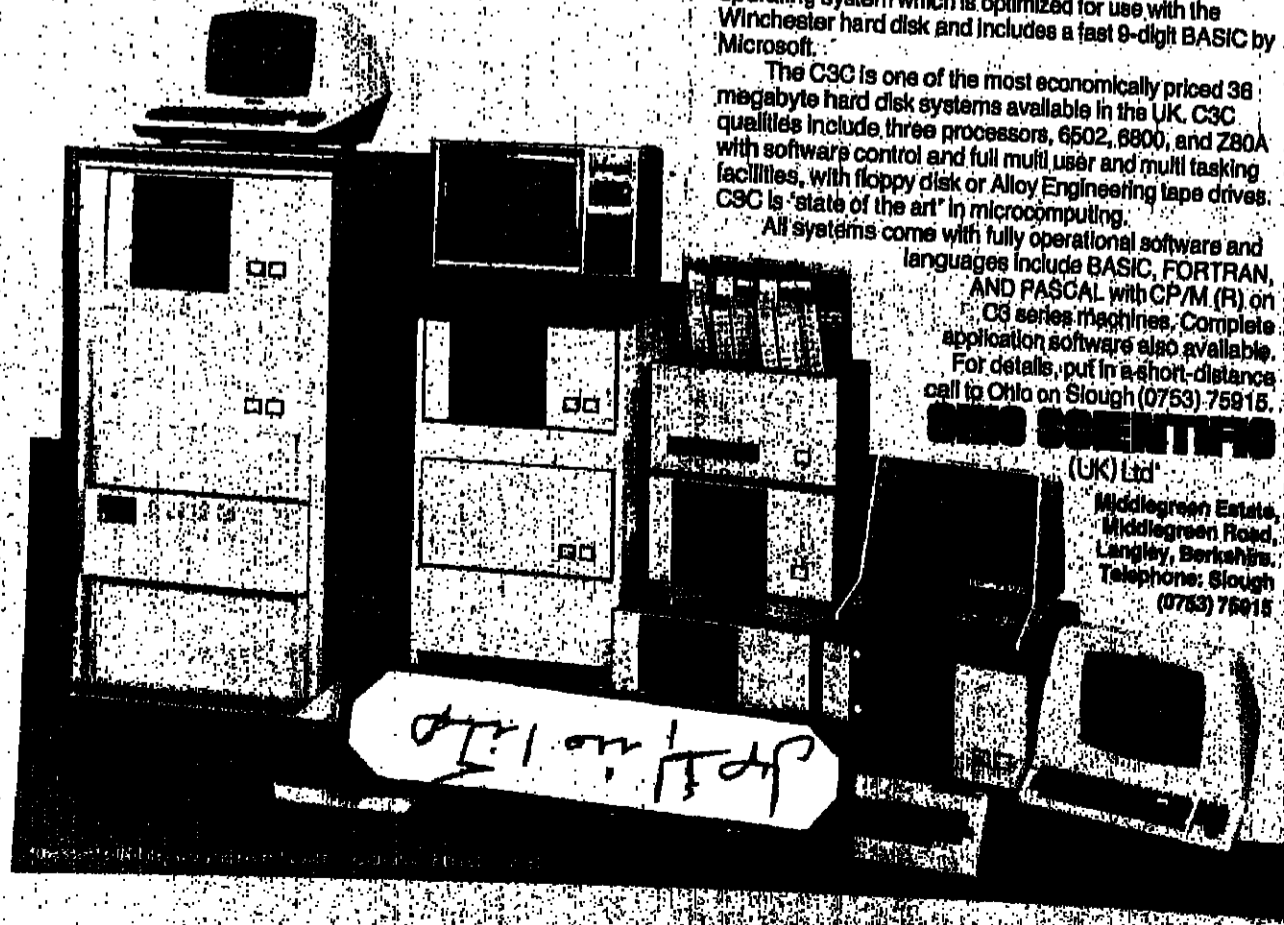

The C3C is one of the most economically priced 38 megabyte hard disk systems available in the UK. C3C qualities include three processors, 8502, 8800, and Z80A with software control and full multi user and multi tasking facilities, with floppy disk or Alloy Engineering tape drives. C3C is 'state of the art' in microcomputing.

All systems come with fully operational software and languages include BASIC, FORTRAN, AND PASCAL with CP/M (R) on C3 series machines. Complete application software also available. For details, put in a short-distance call to Ohio on Slough (0753) 759115.

# Hobbyist's pastime will become the market of the '80s

WITH the wisdom of hindsight we know that minicomputing captured the lion's share of the growth in data processing during the Seventies. Computer manufacturers which were unknown in the Sixties achieved colossal expansion, especially those that stimulated the commercial and distributed systems market.

With the same hindsight, we can now see that the new market of the '80s is microcomputing. The staggering performance of machines like the Apple computer is an indication of things to come. However, an industry that was started virtually by and for hobbyists has woken up to the fact that two of the key growth areas are office systems and micro networks.

For the past two decades, the data processing and communications industries have expended

considerable resources establishing communications between remote sites. Meanwhile, as computing devices have proliferated, users on local sites in the accounting department often cannot communicate directly with their fellows in the sales and stock departments.

Micro networks are aimed at meeting the need to exchange and communicate data by stringing computers and terminals around a local site, putting processing power at the user point, sharing data storage and peripherals, and

providing the means for one user to send data to another user of the network.

There are as many gradients of network as there are levels of computer and it is important to distinguish between the capabilities and objectives of each type, before making comparisons. The simplest micro networks provide the means of connecting together microcomputers of the same family.

These networks operate at relatively low speeds over short distances and fulfil some of the functions hitherto provided by multi-user computers. Examples include the Nestar system for linking Apples and CP/M for connecting CP/M using micros.

More sophisticated networking systems are addressed to the incompatible market, that is the interlinking of computers from different families. Their objective is

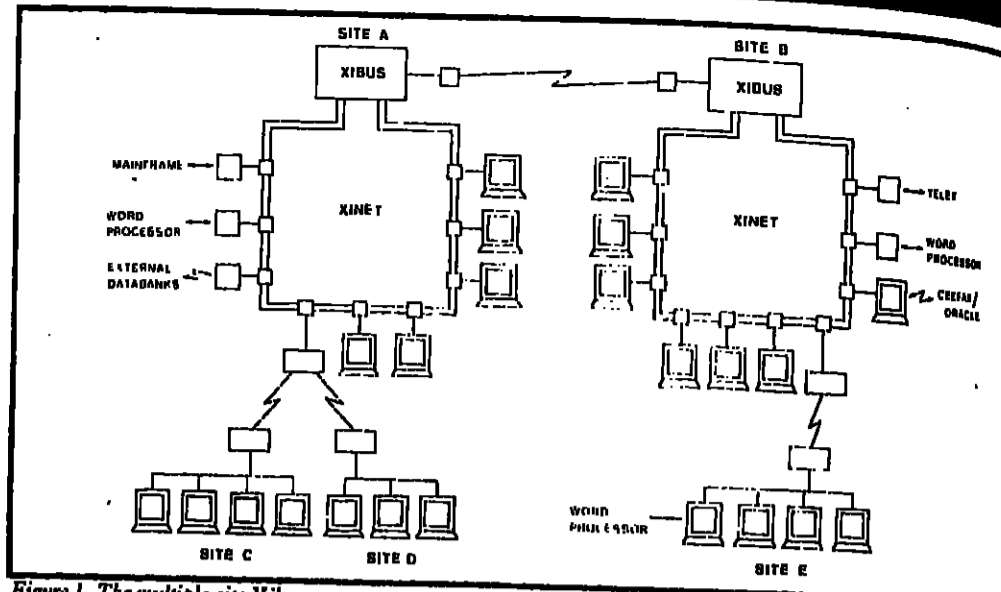

Figure 1. The multiple-site Xibus system

to provide the means of exchanging data in an environment that has grown up with a variety of mainframes, minis, word processors and other terminal devices. The Xerox Ethernet, in some implementations, and the Ungermann-Bass Net/One seek to meet the requirement for a universal networking system.

The most sophisticated systems of all provide the local processing capability of the personal computer network, the inter-computer communications of the universal

network and the powerful data management, high speeds and sophisticated software to handle voice and document image as well as data communications. The Xibus/Xinet system is in this category, providing a highly resilient, general purpose resource to unify the varied computing and digital devices in the larger organisation.

Elements which focus comparison of same family networks include the distance over which micros can be connected, the speed of communication, robustness of the software providing file and record access to the practical number of attached devices. The Nestar system for Apple is limited to 300 metres at speeds of 120K-bits per second and a practical limit of two to three dozen attached devices.

Z-Net, Zilog's Ethernet-like system is one of the most sophisticated of the local networking systems. Two of its provisions increase the efficiency and stability of networking: carrier sense and collision detection. Carrier sense ensures that when a node requires access to the channel, it is not allowed in if another node is transmitting. Collision detection occurs if two nodes transmit simultaneously, in which event both automatically back off and retransmit. Z-Net takes two types of node: a processor or controller station and a shared data station.

Processors are typically Zilog MCZ-2 microcomputers, each with 64K RAM and optional 2.4 megabytes of floppy disc. These microcomputers can operate as standalone devices and each has an interface to Z-Net. The shared data station is a 10-megabyte cartridge with up to 40 megabytes available. Cabling is inexpensive TV co-axial. Between each station and the cable is a transceiver, a combined modem and transmitter/receiver. Data is sent round the network in SDLC-like packets.

Software available on Z-Net includes a sophisticated data manager allowing both file and record access. Cobol, Basic and PL/Z are available for development. Cost of a Z-Net system depends on configuration but users could start with a two station entry level system and build up to a six station system comprising 6 MCZ-2 microcomputers, 6 transceivers, 6 cables, a shared 10-megabyte disc and printer for under £30,000.

The Xibus system (see Figure 1) comprises four main elements: Xibus, the "backbone" data manager and network; Xinet, the network; a workstation or intelligent terminal; and software modules, the library of user tools and interfaces and communications protocols.

Xibus contains multiple processors and Winchester discs interconnected by an internal ring bus. Xinet comprises one or more networks, consisting of intelligent sockets interconnected by multi-core cable. Xinet data rate is one megabyte per second. Both Xibus and Xinet are designed for non-stop operation and contain sophisticated internal diagnostics for self-checking and error reporting. Xibus and Xinet place no restriction on the type of data dealt with. The system can be used for conventional data processing, text processing, messages, digital fac-

simile images and digitised speech. All such data can be transmitted from one attached resource to another, stored within Xibus and retrieved. Remote Xibus systems can be connected to one another.

The workstation is an optional multi-function terminal for attachment to Xinet. It comprises a screen, special keyboard, 20 processors, 64K RAM and various interfaces. Its use is not mandatory other than as a console for device administration, and an alternative microcomputer or intelligent terminal can be attached. However, the workstation has a set of facilities which provide for the creation, alteration, storage, retrieval, searching, formatting, communication and processing of data. Additional facilities include the provision of Micro Focus DB, Cobol, Digital Research CP/M and Microsoft Basic.

The workstation and other devices (terminals, microcomputers, word processors) are connected to the intelligent socket via a communications adaptor. The CA has up to 16 programmable interfaces and executes or converts a variety of communications protocols. The Xibus/Xinet user acquires the system with a set of protocols and each organisation customises its special interfaces required. Mainframe interfaces include IBM 3270, ICL XBM, Univac 1100/200, UTS400, Honeywell Teletype. Word processing interfaces include Intel, Vidi, Philips. Other interfaces include Gandalf switch, Case message switch and links to Cefax, Omnic, Prestel and other external devices.

Xibus is a powerful system with a number of features which make it more detailed treatment than a short article will allow. The system is, and needs to be, highly resilient since any organisation coming to depend on this type of architecture must have non-stop operation.

All data is stored twice, on physically and logically separate discs. Every item transmitted is checked at every stage of transmission. All requests for data are subject to authority checks and clearance. The cost of a Xibus/Xinet system will vary significantly as a factor of the number of attached local and remote resources. Typically an organisation will invest £75,000 in the first instance to set up a site with a fully duplicated 80 megabyte Xibus data manager, Xinet network ring and cabling, intelligent sockets, 64K workstations and the communications adaptors for the attached resources.

In the longer term, maturity of networking system will evolve as companies step forward with the new technology. Systems of the Z-Net and Xinet type are not mutually exclusive. It is possible to envisage a situation in which Xibus handles the central kernel of DP requirements, manages the interchange of data between sites and connects to a local Z-Net system handling the needs of the office sites.

In the software feature of Xibus 19 a table referring to packages of software is printed. It lists software from IDC, Eurocom, and other independent packaged software. Markets in Western Europe 1983.

## BOOKS

Alan Simpson looks at four recent publications dealing with new technology and communications

# Word processing guide is just what the wealthy company doctor would order

The International Word Processing Equipment Guide 1980-81. Keith Wharton. 80pp £35. Geyer-McAllister/Covent Garden Publications. Tel: 01-940 7368.

THE ONLY surprise about this book is its price. £35 seems a hefty amount to pay for an 80-page publication, the bulk of which (advertising apart) is a list of products and suppliers.

Cost can be justified if the prospective purchaser takes the opportunity presented by the guide to

compare prices and specifications, then acts accordingly.

There would appear to be considerable scope for savings. Text editors, by which the publisher means word processing equipment, range in price from £85 for a Business Data Product to £66,000 for a Nexos range model.

The Meridian line appears to be about £6,500 for a system incorporating a screen and two diskettes or magnetic tape cassettes.

In all other respects the book is pretty much what the company

doctor would order, and there are useful obligatory sections on how to choose a word processor, dictation equipment, electronic typewriters, facsimile and photocopiers.

Possibly because the book is now in its fifth year of publication, some basic elements of understanding have been omitted.

The section on text editors plunges directly into a world of daisy wheels, jet printers and communication protocols. A basic annual update would be useful for the casual or first-time reader.

More worrying, at least for the first-time buyer, is the suggestion that the product life cycle of equipment designed and marketed for the office environment has shortened dramatically.

Current ranges of electro-office typewriters could be phased out during the next three years. Demand for electronic typewriters could be high and interested prospective buyers are advised to place their orders now.

Given the explosive growth of the electronic office market place,

the publisher might well be tempted to publish twice yearly but in the meantime a little more attention to indexing would help.

Not all products listed are covered in the address tables nor incidentally are there any telephone numbers. Communications links appear to favour the Post Office rather than British Telecom.

For those who have a responsibility for purchasing office equipment, however, the book provides a valuable guide to what is available and where to get it.

## On an expert level

Introduction to Communication Science and Systems, by John R. Pierce and Edward C. Posner. 390pp, £27.50. Plenum Publishing Corp, New York.

THE SCIENCE of communication is fast becoming an everyday aspect of DP installation life as most computer professionals would agree. Remote terminal displays, time sharing and real time distributed processing are connecting the communication world with that of data processing.

It is not the general rule for DP managers to be omniscient about communication matters like gaussian noise, linear predictive coefficients and biorthogonal coding but the need for specialists with that degree of understanding is becoming essential.

The authors are professionals at California Institute of Technology and have an extensive background both as teachers and as research workers in communication technology. They must have made full use of the Colloquy library, their references including 1928 data about oscillographic observations on the direction of propagation and finding of short waves and a 1937

paper on variable frequency electric circuit theory.

This work is an addition to a series dealing with applications of communications theory, the complete set of which would serve as a basic collection on the theory and practice of communication science.

Introduction to Communication Science and Systems is directed at the electrical engineering student or specialist with an advanced approach, although the series editor suggests the technical depth is graded, becoming progressively more difficult in the course of the study.

To ensure that the reader has been paying diligent attention, there is a series of problems at the end of each section. As in all good text books, solution manuals are available only to qualified instructors.

Graded or otherwise, the book is aimed towards the expert. Beginners in the high technological world of communications are advised to seek out a basic primer before taking the "introductory" plunge.

## Calculated work

Programmable Pocket Calculators by Henry Mullish and Stephen Kochan. 254pp, \$8.95. Hayden Book Company Inc.

A CASUAL reader might be excused for wondering what is the future, should there be one, for desk top calculators or even personal microcomputer systems.

Hard copy listing apart, the power, scope and versatility of PCs is considerable. The book, which concentrates in the main on Hewlett-Packard products, selects the HP 65 "superstar" as the best buy.

When the history of the PPC comes to be compiled, Hewlett-Packard is guaranteed to figure prominently. Having set in train the calculator revolution in 1973 with the HP 65 costing \$800, the company produced a regular series of upgrades.

Current star of the pocket space age technology is the HP 33B which sells for about \$100.

Programmable Pocket Calculators describes in detail the function of each model, featuring architecture, special factors and program techniques.

Every program for each calculator is incorporated in schematic design, showing how to enter the program and operate the calculator.

For those whose use of calculators is limited to VAT assessment or comparing prices quoted in litres or metres, a PPC is a needless item of equipment.

But students, engineers and computer programmers have found a PPC has become an essential tool of their trade, though it helps if the reader has a ready opportunity to acquire a suitable calculator.

## A practical approach

Database Design and Implementation on Main and Mini-Computers by Daniel Martin. £9.50 cloth, £4.50 paperback. Van Nostrand Reinhold, 1980.

DATABASE technology is claimed to offer many advantages over conventional approaches to computerised data handling. Despite this, relatively few organisations have taken this route towards integrating their data processing activities.

This situation may be a direct consequence of the lack of suitable practical guidelines for building a database.

If so, this book may help rectify the situation since it applies a "practical approach" to the

subject. There are two general ways of constructing a database: either one uses a commercially-available database management package or one reverts to fundamental principles. This text is devoted to the latter approach.

The book contains only four chapters, the first introducing primitive definitions (database, logical and physical record, block, buffer, pointer, etc.) necessary to understand the subsequent material.

Each chapter is concise and probably adequate for the author's intended audience - the experienced DP practitioner.

## For American consumers only

A Consumer's Guide to Personal Computing and Microcomputers by Stephen Freiburger and Paul Chew. Jr 198pp \$8.95. Hayden Book Company Inc.

THE PRODUCTION rate of books dealing with personal computers must be challenging that of

the micro chip. A consumer's guide is the latest in the long line.

A cover quote describes the publication as one of the hundred outstanding sci-tech books. Alas, authors Freiburger and Chew have not quite produced another Close Encounters, Hitch-Hiker's

Guide or Flash Gordon.

The book is more down to earth presenting practical information on over 100 microcomputer products from over 60 manufacturers.

Apart from the Z80, Apple and Pet ranges, companies include Gilmix Inc and Parasitic Engineers.

## Assessing the impact of micros

The Impact of Microelectronics, by Rada, 100pp, Sw Fr 7.50. International Labour Office, 96-98 Marsham Street, London SW1P 4LY.

PUBLISHED by the International Labour Office, Geneva, this book would perhaps have been better entitled "The Impact of Microelectronics on Employment" as it concentrates largely on this aspect.

As the back cover states, "The study identifies the sections of the labour force that are likely to be hardest hit and pays particular attention to the probable effect of the new technology on the international division of labour and on developing countries".

Given the emphasis of impact on labour, the book is well-balanced. There are several minor technical errors such as "package switching" (for "packet switching").

Another irritant is the confusion between footnotes and references. Both are listed at the end of each chapter and it would have been better for footnotes to appear.

# COMPEC EUROPE '81 MAY 5-7 1981 EXHIBITION - BRUSSELS

## SPECIAL TRAVEL ARRANGEMENTS

COMPUTER WEEKLY in association with COMMERCIAL TRADE TRAVEL LTD., has arranged special trips to Compec Europe Exhibition in Brussels. Accommodation has been reserved at the SHERATON Hotel in Rogier Place, opposite the fair grounds.

### Itinerary

There are two special arrangements, one for Exhibitors, staying five nights, and one for Visitors, staying two nights. Flights are by scheduled services from London (Heathrow or Gatwick) airports on flights of your choice subject to availability.

Price per Person (Sharing twin bedded room with facilities)

Tour A 5 nights	Sheraton Hotel
Tour B 2 nights	£265.00
Single room supplement (per night)	£175.00
	£20.00
Accommodation Only Twin with Bath	£59.00 per night
Single with Bath	£50.00 per night

### How to Book

Complete the booking form and post immediately to the tour operators, Commercial Trade Travel Ltd., Carlisle House, 8 Southampton Row, London WC1. Tel: 01-405 8666/5469. Telex: 21792/949. A deposit of £30 per person is required and cheques should be made payable to Commercial Trade Travel Ltd. A confirmatory invoice will be sent and the balance is payable on receipt of invoice. Tickets etc. will be despatched about 7-10 days before departure.

Booking Form

Name: \_\_\_\_\_ Address: \_\_\_\_\_ Telephone Number: \_\_\_\_\_

Additional contact Person: \_\_\_\_\_

Company Name: \_\_\_\_\_

Exhibition Booth Number: \_\_\_\_\_

Departure: \_\_\_\_\_

I hereby confirm my booking and agree to the terms and conditions of the booking. I understand that this booking will be held by the tour operator and I agree to pay the balance on receipt of invoice. I agree to pay the balance on receipt of invoice. I agree to pay the balance on receipt of invoice.

Signature: \_\_\_\_\_ Date: \_\_\_\_\_

## Technical Writer Computer Software

We're looking for a top-class technical writer with proven ability in computer software. He or she must have considerable aptitude and experience in two areas.

### Plain English

People who think they can write are easy to find. But we're not looking for someone to do cut-and-paste job on a programmer's specs, simply putting the commas in the right places. We want a writer who can organise difficult material skilfully and then write good plain English that's easy to read and understand. A writer who instinctively chooses the right word. If you're in that class (and we don't think there are many who are) you're halfway there.

### Technically speaking

The right person will have solid experience of computer software, ideally including IBM systems or program products. We're talking about a level of experience that means you'd be able to hold your own in conversation with our development programmers within a short time of joining us.

A writer who can meet these demands is going to be someone out of the ordinary. So we expect not only to reward you well, but also to give you interesting work and plenty of scope for your talents.

### Getting involved

Initially if you join us, you'll be developing tutorial and reference information for users of our program product CICS/VS. In the longer term, you could find yourself writing about any of the software products being developed at Hursley, near Winchester. They include interesting things like graphics software systems for colour display terminals. And we won't necessarily restrict your efforts to the printed page. We may ask you to produce on-line tutorial and 'help' information for interactive terminal systems.

### Still with us?

If you have the experience and ability we're looking for, we'd like to hear from you. Write and tell us about yourself. If we ask you to come to talk to us, we'll want you to take a writing test. But if you're the sort of writer we're looking for, that won't worry you.

As a company making a substantial contribution to the country's economy, IBM employs 15,000 men and women at over 40 UK locations. Some 4,000 work at our two manufacturing plants and another 1,500 at the Hursley Laboratory.

IBM's comprehensive benefits package includes an attractive starting salary; BUPA membership, free life assurance and non-contributory pension scheme. Where applicable, the appropriate relocation expenses to this attractive part of Hampshire will be reimbursed.

Please telephone Ron Slater, Personnel Officer, on Winchester (0962) 4433, extension 6413 for an application form, or write to him at: IBM United Kingdom Laboratories Limited, Hursley Park, Nr Winchester, Hampshire SO21 2JN. Please quote reference: CW/9222.

## ELECTRONICS ENGINEERS

**Hardware Design:**  
Belgium. Annual term contract positions.

## Have you a good print/publishing idea?

Principal of Group of printing factories wishes to meet person with a viable new idea that involves printing on paper or card, and would have good sales potential or a known market.  
Please write in first instance to Mr. E. Slater, Falkenwood, The Street, Great Toy, Colchester, Essex.

<b>BUCKS MICROS</b> Software Engineers with 3-5 years' experience on micros and small minis required to work on new comm. projects with innovator in this field. Degree preferred. Location of offices North Bucks. <b>£7-9K</b>	<b>MINIS HERTS</b> Programmers with Mini Assembler and preferably some knowledge of COBOL, required by Manufacturer of key-to-disk, database management and distributed processing systems. Some telecoms experience appreciated. <b>£6.5-9K</b>	<b>FORTAN</b> Analyst/Programmers and Programmers with sound Fortran experience, who enjoy meeting clients and working in a technical support role, sought by leading London-based. Applications chiefly manufacturing orientated, Victorian area. <b>£7-8.5K</b>
--	--	---

<b>DEC READING</b> Programmers and Analysts with PDP 11, Macro 11 and related backgrounds are sought for a variety of projects in European Software Group based at Reading. Applications chiefly scientific/technical rather than commercial, degree level education preferred. Some travel required. <b>£8-11K</b>	<b>BANKING LONDON</b> Senior Programmers and Analysts required by American bank to work at advanced installation in London on IBM mainframes and PDP 11's. Requirement is for COBOL (OS) preferably with CICS, ADABAS or Assembler experience. APL also of interest. Outstanding benefits for the right applicants. <b>c. £11K package</b>
---	--

<b>CAD S/W ENG</b> Software Engineers and Designers with experience of CAD and technical software on DEC, Ibm or similar, with Fortran/Assembler, wanted for research development work being undertaken by this East Anglian Establishment. <b>c. £8K</b>	<b>PL/1 EUROPE</b> Swiss and Dutch opportunities for Programmer/Analysts and Programmers with considerable PL/1 experience (minimum three years). Some knowledge of TP and DB systems would be an advantage. Relocation assistance offered. <b>£12-16K</b>	<b>TECH ADVISERS</b> Communications, networks, office automation and Viewdata Consultants/Advisers (aged 25-35) sought to join leading London Consultancy. Professional and presentable appearance must be combined with excellent technical skills. Excellent benefits. <b>to £15K</b>
---	--	---

<b>MINIS MICROS</b> Consultants, Software Engineers and Programmers required to work on defence/command and control/industrial/Viewdata projects with highly respected British Systems House. Good academic background plus relevant experience in any of the above fields (on minis or micros) essential. Surrey location. <b>to £12.5K</b>	<b>GERMANY PDP11 &amp; RSX11-M</b> Software Engineers with real-time PDP 11 or LSI 11 Assembler (minimum 3 years) wanted to join small team involved in development of industrial measurement and control systems for leading supplier in this field. Excellent relocation to pleasant Rhineland area. <b>£10-14K</b>
--	---

10 Grenville Place  
London SW7 4RW  
01-373 3063

## The AEW Nimrod real-time system.

The most challenging systems project  
you could ever work on.

There's nothing in the world like the real-time data processing system that's the heart of the Airborne Early Warning Nimrod. This is a fact, not opinion. The system handles all the data from one of the world's most advanced radars, from the aircraft's communication equipment and instruments, and from other sensors. It operates within the strictest definition of real-time, and to the highest standards of software integrity.

If you're becoming increasingly frustrated with designing and implementing systems that all seem to have much the same applications, come and work on the AEW Nimrod software and its associated proving facilities.

You'll be more familiar with the work than you might imagine - especially if you have a solid background in real-time systems and analysis.

But the one thing you won't be familiar with is the interest and satisfaction of becoming totally involved on a major system with a totally new application.

And on that score, few jobs can compete with these.

### Mission Software Team Leader

The team that you will lead will produce mission software to enable all

crew in the AEW Nimrod to interrogate the central AEW database and control aircraft subsystems. You will understand the customer's operational and technical requirements and will liaise with hardware and design teams. You have had leadership experience and a knowledge of CORAL 66 and real-time systems.

### Mission Software Engineers

You will implement mission software in a team which will provide operator facilities to air crew operating the AEW Nimrod. The software will run in the central computer and interface with both microprocessor based operator consoles and also complex electronic subsystems. You have at least 18 months' relevant experience with high level languages, preferably CORAL 66.

These are positions open only to men and women who have the relevant experience. Posts are also available in other locations for those with equivalent experience and for those employed in related fields who wish to broaden their experience.

Write giving brief details of your experience to C. Hill, Marconi Avionics Limited, Elstree Way, Borehamwood, Herts. Telephone 01-953 2030, extension 3449. Alternatively, telephone 01-207 3455 anytime. Please quote reference MA/83/23.

## Training Officer

The Education and Training Section of the Information Systems Division provides an Education and Training service to all STC/ITT users of the Group's computer services.

Reporting to the Section Head, Education and Training, this post will:

- 1. Provide training and organisation of courses, starting with the fundamentals of computers, usually at New Southgate.
- 2. Look after the administration of training, and organise people to go on internal and external courses.
- 3. Keep training records up to date.
- 4. Liaise with all DP functional managers to decide on education and training requirements, and the release of staff.

The work will involve a certain amount of travel to other U.K. sites.

We are looking for somebody with a wide experience of Data Processing and Information Systems.

Knowledge or experience of education/training/lecturing would be desirable.

Please apply for an application form quoting ref: REB 31 from our Senior Personnel Officer, Mr. R. Edmonds-Brown on 01-368 1234 Ext. 2579 or in writing to: The Recruitment Department, Standard Telephones and Cables Limited, Oakleigh Road South, New Southgate, London N11 1HB.

## ★ ANALYST PROGRAMMERS ★

### ★ Data General Nova ★

Permanent or contract for several early-start 24-month assignments in Central London. Experience of Business logic under RIMS required.

## Hardware/Software Designers Systems Analysts

Enjoy the big challenge  
in marine systems

The illustration has nothing to do with having a whale of a time with Plessey... We take that for granted.

The message is all about marine systems development - a fascinating business and of supreme importance.

If you are looking for a stimulating challenge, we want to talk to you about joining a first rate team of professionals designing distributed mini and microprocessor controlled real-time systems for marine applications.

If you have 3-10 years' experience as a systems analyst or hardware/software designer able to determine the right balance of hardware and software to make a viable system, then we can offer you a worthwhile career at the forefront of technology. The challenge is the hardware and software design & development of microprocessor and micro-programmable based systems using the latest LSI technology and software engineering techniques.

You should have relevant experience in real-time systems such as defence, message switching, communications, signal processing or related applications. Ideally, you are experienced in RSX11M, Coral 66 or Mascot, as well as in mainframe interface and programmable hardware.

Templecombe is a picturesque village in the heart of Somerset, yet close to Bournemouth and several large towns. Salaries will be into five figures and an excellent relocation package will make the going easy.

To discuss the matter in confidence... Just ring or write giving brief career details to Robin Churchill, Technical Recruitment Manager, quoting ref: TEM/84 at Plessey Marine Research Unit, Wilkinstrope House, Templecombe, Somerset. Tel: Templecombe (0883) 70551.

## CASH IS KING £6½K - £17K

## Consultants (RSTS/E)

Zurich, Luxembourg, Frankfurt **c. £16,000 + Exps.**

Our client, a Swiss Management Consultancy, with offices in the above locations wish to recruit professionals to strengthen their current project teams involved in the development and installation of banking systems, throughout Europe. Ident experience would be 3 years Basic + or Basic + 2 in a RSTS/E environment as a senior member of a development team. This being a permanent overseas appointment, candidates must be self-motivated, adaptable and be prepared to travel between project locations when the need arises.

Contact: Brian Postle

## Analyst/Programmer

London **c. £11,000 + benefits.**

Our client, a well established commercial organisation, a household name, wishes to recruit an Analyst/Programmer to work in the System Support Team which has a responsibility for the efficient and effective running of live applications and the provision of an enquiry facility to the User Departments.

Candidates should have around five years experience in an IBM OS environment with a substantial background using PL/1. Knowledge of financial/accounting systems would be an obvious advantage.

Contact: Jim Baker

## Consultant

London **Quality Assurance to £10,000**

Our client, a very successful consultancy has grown steadily in the extent and complexity of its operations. They are currently seeking a Software Engineer with the experience and ability to make an immediate contribution in a demanding team environment. The QA team works in close co-operation with Project Leaders and therefore have an opportunity to acquire a unique overview of the company's activities. The appointee will play a significant role in the audit and review of technically advanced applications with special reference to Defence projects. Applicants will be able to demonstrate a successful technical background which will include an appreciation of electronic engineering and QA procedures.

Contact: Margaret Stevens

## Programmers

City **To £10,000**

Our client, a highly reputable British Merchant Bank wish to recruit 2 programmers to join a small team responsible for the introduction and development of a comprehensive range of banking and financial applications. Applicants should have at least 4 years experience in d.p. preferably gained on Hewlett Packard equipment together with a good working knowledge of COBOL. Familiarity with IMAGE or TOTAL databases is essential. Special preference will be given to candidates with a banking background. Usual banking benefits apply.

Contact: David Hendry

## COBOL Programmers

Sussex/Hampshire **c. £9,000**

We are in the process of recruiting competent COBOL Programmers. For two of our clients, both well established systems houses. A minimum of three years sound COBOL experience, preferably from an on-line or real-time environment with particular emphasis on ICL MB 28 or 2800 series using IOMS. Consideration will be given to candidates with a good COBOL programming background using other hardware. Applications experience should be accounting and financial. Opportunities will exist to progress into analysis but it is essential to have a preference to stay in programming for the immediate future.

Contact: Janet Chivers

## Communications Programmers

London **c. £8,000**

We have been retained by an international consultancy organisation, who are expanding their development in Videotex systems, to recruit two software programmers to be involved with this exciting application. Applicants should have at least two years' programming experience, preferably with FORTRAN on PDP 11 or VAX 11 in a communications environment. Knowledge of X25-3270, packet/message switching would be an advantage. Ability to work with users with minimal supervision is essential.

Contact: Jim Baker

# Wise counsels smooth path to employment

by Robert J. Peeling, managing director of CPR Consultants Ltd.

RECRUITMENT in the North of England is an emotive issue, seen in the light of redundancies caused by a deep recession which has the consequent effect of creating severe financial restrictions. Even if redundancies are avoided head counts are looked at closely, recruitment ceases and natural wastage is allowed to occur.

The general effect on the computer industry has been patchy, computer users probably being under the tightest restriction, presumably because of their proximity to the consumer market-place.

This is not to say that computer manufacturing and supply organisations have escaped serious setbacks, as evidenced by the large-scale redundancies which have taken place.

Some supplier areas are booming, particularly micro manufacturers and OEMs which are springing up in true entrepreneurial fashion all over the country.

Little media space is given to the considerable number of success stories while every "snipper" of dependency perceives its full share of column inches confirming the old maxim that only bad news is news.

Redundancies create difficulties both for the professional recruitment organisation and the potential

employer.

The market becomes flooded with a whole group of people having a whole range of skills to offer from trainee programmer through to general manager. Understandably, the redundant personnel react in various ways ranging from mild panic to hysteria.

Individually, they assemble career details hurriedly and send them off to every conceivable computer-related source of employment besides contacting every personnel organisation they know.

The results of this approach are apparent in the personnel industry where chaos prevails with various organisations producing the same details on the same man and then putting him in front of the same potential employer.

From the employer's point of view, his desk becomes littered with various resumes depicting the same potential employer in many different fashions.

Again understandably, the would-be employer scoops the whole pile of paper into the waste-paper basket and waits for everything to settle down. When a consultancy is approached by redundant personnel our first job is to calm them down and try to put them back into a rational frame of mind.

After this first step, we will try together to identify the comparatively few companies which should be interested

and only then do we endeavour to put a fully-detailed and coherent resume in front of as few people as possible.

Our own area of recruitment expertise covers sales, software and engineering. The consultant vets all applications coming into the organisations, sifts out the "dross" and interviews up to the final selection stage, short-listing potential candidates.

The recession has had the effect of causing an overseas recruitment market boom as countries such as South Africa, moving into high-technology installations rapidly without home-grown experience, realise that the UK has such experience to look for permanent situations within the industry.

It is essential that their recruitment profession is explored carefully as the last thing any potential employer wants is a highly-experienced new employee using the firm as a stepping-stone to the point where the contract market becomes lucrative once again.

It is said that if a company can operate successfully in a recession then its success is guaranteed in normal times. In the light of this we find it reassuring that within our own industry there are many companies which, having "honed" and streamlined themselves, are not only operating successfully but are in an expansionist frame of mind.

Another area that is hard-hitting traditionally is that of research and development, essential to companies intending to maintain viability in a market renowned for its speed of technical advancement. R & D is always one of the

## Computer Professional Recruitment Consultancy

CPR Consultants are the only professional recruitment and management consultants who have locations conveniently placed in London, Manchester and Leeds and who guarantee that all Senior Consultants employed are 15-year plus career professionals in the Computer Industry. This combined with many years of professional recruitment expertise to provide unique services, including:-

## UMIST

### MICROELECTRONICS APPLICATIONS UNIT (MAU) MICROPROCESSOR SOFTWARE DESIGN COURSE

7th and 8th APRIL (Course Ref. C0071/13)  
A 2-Day Course for Engineers and Programmers.

This new course is configured for the Engineer and/or Programmer who already uses Microprocessor Systems and who wishes to improve his/her software design methods. The course consists of a series of Lectures covering the various aspects of Microprocessor Software Design with particular emphasis on Program Design, which is explained through the use of a problem orientated PASCAL-like notation. No previous knowledge of PASCAL is assumed. Cost, including lunches and refreshments is £130.

For further details contact:  
The Registrar (Special Courses), UMIST, P.O. Box 86, Backville Street, Manchester M60 1UD. Tel. 061-236 3311, Ext. 2713.

## SOFTWARE ENGINEER DIGITAL CONTROL SYSTEMS

The company is part of a broad based, sophisticated enterprise involved in the design, engineering, manufacture and marketing of process control systems for industry and the public utilities.

We presently have a vacancy for a suitably qualified software engineer (male or female), who will be responsible to the Digital Systems Manager for producing completely operational, tested control systems based on our standard DCI 4000 range, which comprises of a hierarchical family of microcomputer based products.

Essentially we are seeking a sound practical engineer, who would probably work from our Harrow office, and who is qualified to HNC technical standard or has an equivalent industrial background. Experience in instrumentation control or systems engineering would be an asset as would be some knowledge or experience of a high level language (e.g. Pascal, Basic, etc.) computer hardware, digital electronics. Comprehensive training will be given in all aspects of the job, including the specific software selected with DCI 4000. The preferred age range is 21-35 years (not rigid) but the successful candidate will need to be highly mobile as extensive travel throughout the UK is envisaged. He/she will need to be self-starting with a forward outlook and the propensity for demanding work.

The company offer a potentially rewarding career, a competitive starting salary, good conditions of employment and the opportunity for some travel abroad in the USA and Europe.

**SHEFFIELD CITY POLYTECHNIC**  
DEPARTMENT OF COMPUTER SERVICES  
HERD  
**SENIOR TECHNICIAN**  
POST NO. 7  
T3 (under review) £5,178 - £5,796  
plus qualification allowance  
2% from April 1.

We are installing a data communications network linking five major Polytechnic Sites.  
Initially it will serve terminal communications to two computer systems, an IBM 4341 and an IBM 370/145 handling over 160 terminals. Later it will expand to serve more terminals; microcomputer and minicomputer links for a wide range of applications.  
The person appointed will be involved in the installation and maintenance of the communication and terminal equipment.  
Applicants should preferably have at least HND or an appropriate discipline (or equivalent) and sound relevant experience.  
Application forms and further details are available from The Personnel Officer, Sheffield City Polytechnic (Dept. CW), Halfords House, Fitzalan Square, Sheffield S1 2BB or by telephoning 20911, ext. 361.  
Completed forms should be returned by 20th March. (4781)

**UNIVERSITY OF GLASGOW**  
ADMINISTRATIVE DATA  
PROCESSING  
**PROGRAMMER/ANALYST**

Applications are invited from suitably qualified persons for the post of Programmer/Analyst in the Administrative Data Processing Section of the Registrar's Office. All administrative systems are currently run on the University's ICL 2978 computer. A DEC PDP11/24 minicomputer system is being purchased. The person appointed would be involved in both the maintenance of current systems and the new programming applications which are planned.  
Applicants should hold a University degree or equivalent professional qualification. Preference will be given to those with experience of programming or analysis in a data processing environment but prospective graduates in Computing Science may apply. Salary will be on Grade 15 of the scales for Other Related Staff (ES06-ES08), under review, with initial placement dependent upon qualifications and experience.  
Further particulars may be obtained from the Secretary of the University Court (Room 1B), University of Glasgow, Glasgow G12 8QQ, which includes applications in duplicate, giving names and addresses of three referees, should be lodged on or before 20th March, 1981.  
In reply please quote Ref. No. 47817. (4780)

**THE UNIVERSITY OF LEEDS**  
UNIVERSITY  
COMPUTING SERVICE

Applications are invited for a post of

**COMPUTING ASSISTANT**

In the University Computing Service. Applicants should have a good honours degree or equivalent, preferably together with at least two years relevant postgraduate experience. A higher degree could be an advantage. The appointment will be for a fixed period of up to three years. The Computing Service is responsible for the provision of computing facilities to all departments within the University and has recently acquired an Amdahl V7 mainframe computer and a Prime 750 Computer. The successful candidate will work principally within the Applications Group which develops, maintains and advises on the use of applications software.  
Salary at an appropriate point on the 15 Scale for Other Related Staff. Details of the scales for Other Related Staff (ES06-ES08), under review, with initial placement dependent upon qualifications and experience.  
Application forms and further particulars may be obtained from the Secretary of the University Court (Room 1B), University of Glasgow, Glasgow G12 8QQ, which includes applications in duplicate, giving names and addresses of three referees, should be lodged on or before 20th March, 1981. (4780)

**The Polytechnic**  
of North London

**POSTS IN**  
**MICROCOMPUTING**  
**PROGRAMMER**

The Polytechnic is in the process of implementing interactive solutions, computer based systems over a wide range of college administration including multi-use systems in the Finance Office and decentralised staff in Faculty Offices.  
A Programmer with initiative is required to job the small Managers Information Systems team to complete the implementation of existing programs, set up these as a multiuser system and subsequently develop other areas. Most programs have been written in C Basic. Experience in this particular language is not essential but experience of high level language programming is required.

**TEMPORARY PROGRAMMER/RESEARCH FELLOW**

A graduate is required until the end of September 1981 to help complete a research project involving the development and programming of a distributed micro computer based system for handling student records. Some high level language programming, not necessarily related to micro computers, is essential.

**TECHNICAL SUPPORT**

The Polytechnic Computing Service operates a Microcomputing Unit for teaching and research, containing a wide range of equipment, eg. Nascom, Pet, Apple, RN 3802, Vector Graphics, and with facilities for colour graphics, digitising and plotting. Planned developments include resource sharing ring systems. Further technical support is now required in equipment maintenance, advisory services to users, and applications software. A Technician Grade 3 post is now available, for which the qualifications are ONC or OND or 2 'A' levels or Ordinary City and Guilds or equivalent. At least three years' experience (including training period). A Programmer appointment could also be available for graduates (or equivalent) with some programming experience preferably in the microcomputer field.

The Polytechnic's large DEC 10 will play an important backup role in all these posts there will be opportunities to gain experience of handling micros to mainframes at systems design and programming level. Salaries are on the following scales (which include London Weighting, starting point will depend on qualifications and experience).  
Technician (Grade 3) £5,325-65,000  
Programmer £4,377-55,810  
Research Fellow (Temporary Post) £6,232-66,924  
Further details and applications form (please state post in which interested) from Head of Computing Services, The Polytechnic of North London, Holloway Road, London N7 8DB. Telephone 044 2789 ext. 2295.

**CREASEYS**

**MICROCOMPUTER**  
**SALESPERSON**

We are looking for a Salesperson who has computer or systems experience to sell the latest range of Tokes Instruments microcomputers.

We are a well-established office equipment company committed to the growth of this new and exciting industry.

A good basic salary plus commission (guaranteed during training), company car and expenses.

Write or telephone for an application form to Mr. P. Millard - Creaseys of Hertford, Cammerton, Hertford SG14 1LH. Telephone: Hertford 64848.

**Computer Operations**  
**Emphasis on communications**

This position reports to, and deputises for, the Computer Operations Manager at Burmah's Data Centre in Swindon. The hardware is IBM 3031 and 4300. As our Operations/Communications Controller, you would be responsible for maintaining the Centre's very high operating standards, through effective supervision and co-ordination of operations and by continuous training and motivation of staff.  
We are particularly interested in someone with a keen interest in, and awareness of, data communications technology. Burmah has a well-established nationwide distributed system, makes extensive use of remote job entry, provides a timesharing service for group companies... and you will be expected to give special attention to these key areas.

You should be educated to at least 'A' level standard in numerate disciplines and have a good knowledge of IBM processing equipment. You must possess good supervisory and verbal communication skills, plus of course a thorough knowledge of data systems equipment, operating systems and job control language.

We offer a very competitive salary, excellent working conditions and generous assistance, if necessary, to help you move near to our well-located headquarters.  
Please send a full CV or ring or write for an application form to D O Freeston, Recruitment Manager, Burmah Oil Trading Limited, Burmah House, Pipers Way, Swindon, Wiltshire SN3 4RE. Telephone: 0793 47400.

**LEADERS**

Altergo Business Systems Limited has vacancies for Programmers, Analysts and Project Leaders to work on its expanding IBM System/34/38 and Series 1 business throughout the U.K. and Europe.

These are long-term career positions which offer responsibility, high financial rewards and the opportunity to extend your skills and experience over a wide variety of applications and systems in the commercial and industrial fields.

We are particularly looking for people with enthusiasm, ambition and, above all, a professional outlook. We offer a dynamic organisation which recognises individual achievement. The rewards are a generous bonus scheme, six monthly salary reviews, excellent fringe benefits and an opportunity for rapid growth within the company.

**PROGRAMMERS/ANALYSTS** up to £10K plus benefits.  
Applicants should have at least four years' experience with RPG 11. Knowledge of small IBM machines, especially the System/34 would be a distinct advantage. In addition we would welcome hearing from applicants with practical experience on the IBM Series 1 using the RPS operating system.

**PROJECT LEADERS:** Negotiable.  
Applicants should have a minimum of 6 years' experience in the small business environment and ideally have been responsible for the design and installation of complete systems on IBM equipment.

If you feel that your potential can be realised through the challenge of working within an innovative and stimulating environment with secure prospects for future growth and career development, please telephone Barry Whitesman or Ruth Berger.

## DALROTH computer personnel

### GERMANY SOFTWARE ARCHITECTS

for  
Definition of a new range of computer systems  
**70,000 - 100,000 DM per year**

Dietz is a leading West German mini computer manufacturer who currently wish to define the architecture for a new hardware range. The company is based at Mulheim, which is a pleasant rural location in the Dusseldorf area.

The system will be based on a high-level object oriented multi-micro-processor architecture and will include special purpose peripheral attachments that will match the sophistication of the mainframe system. The following personnel are required:

### Operating Systems Specialists

Ideally candidates will have a minimum of 7 years' experience including file store organisation, task management, virtual memory management, etc, and/or high-level job management interfaces both at the hardware and software levels.

### Compiler Specialists

This is a special assignment involving the design and implementation of a compiler porting system for the new range architecture. There will be a very close working relationship with the Operating Systems team. Ideally candidates will have extensive compiler design and run-time environment experience.

Opportunities exist for travel within Europe and also to the USA. German would be useful although this is not essential. Candidates with similar or related software backgrounds are also invited to apply as additional software personnel will be required for development and implementation later this year.

An attractive relocation and benefits package will be offered with these appointments.

For further information please contact Roger Allington on 01-493 2947 (office) or Berkhamsted (04427) 2299, evenings/weekends. Please quote Ref. CW9848/2

DALROTH & PARTNERS LTD. 4 HALF MOON STREET, LONDON W1.

### PLESSEY CHAIR AND HEAD OF DEPARTMENT OF COMPUTING

£13,995 - £15,432 p.a.

Candidates with appropriate academic qualifications and industrial or professional experience are invited to apply for the first appointment to the newly created Plessey Chair in Computing. The ability to develop research and consultancy programmes in accordance with Plessey policy is of crucial importance and personal participation in these activities is strongly encouraged. Several areas of development are envisaged, including data processing, computer aided manufacture and design, office administration and small business. Candidates who could lead with authority in any of these areas would have an advantage, as would applicants who could demonstrate their significant leadership and involvement in innovative applications of computers in their particular field of specialization. The Head of Department should be able to provide academic leadership to a group of well-qualified staff who have achieved a balanced programme of studies and curriculum development in computing and microprocessor applications. Further details and application forms may be obtained from the Assistant Director (Administration), Trent Polytechnic, Burton Street, Nottingham NG1 4BU. The closing date for the return of applications is 14 March, 1981.

**TRENT POLYTECHNIC NOTTINGHAM**

(4690)

### COMPUTER MANAGER

**£9-£10,000 Per Annum**

To take full responsibility for all aspects of our computer operations including staff supervision, computer planning and scheduling, budgeting and client liaison.

The company specialises in providing services to the reinsurance industry including batch and on-line processing and the ongoing development of systems for clients in the UK and overseas. In addition to a medium sized Wang VS Computer, IBM 370/138 equipment is about to be installed with DOS/VSE, CICS and VS/AM software.

Applicants should have had previous experience in the overall running of small to medium sized computer installations, preferably using IBM equipment and should have a good understanding of the use of the appropriate software and operating systems.

Please apply in writing or by telephone to:

## "I made the right move when I joined IDEC"

"Joining IDEC has given me the opportunity to become involved in big projects and to lead a professional team.

The work is very stimulating and challenging. And it's refreshing to work with co-operative people who will listen to and value your opinions and ideas.

Computers and telecommunications make a very powerful combination, and it is an area in which IDEC is already a world leader. Our new project will take us much further.

In fact, at IDEC, I'm looking forward to the future."

DANIEL ERZEN-  
Systems Consultant

هذه امة الاجل

As a development centre for ITT in Europe, IDEC is an established innovator in high level software for advanced microprocessor based communications systems.

Ours is a fast-moving organisation in a fast-moving industry. And that's why we're looking for experienced and ambitious Software Professionals at all levels to join our successful operation.

With IDEC, you'll become an important member of a talented project team working on a wide variety of challenging projects which will involve highly sophisticated and advanced microprocessor engineering, firmware, software and systems. In other words, you'll gain a broad-based experience in the shortest possible time.

In terms of rewards, you'll find IDEC hard to beat. Our salaries, working conditions, training facilities and fringe benefits are amongst the best in the business. And in our successful, fast expanding organisation, promotion comes rapidly.

So if you're an experienced Software Professional looking to develop your abilities, further your career and reap the rewards your talent deserves, make the move to IDEC.

Like Daniel you won't regret it.

Contact Sue Dowsett or Chris Turner at the address below to arrange an immediate interview. IDEC-ITT, Orchard House, Mutton Lane, Potters Bar, Herts.

Telephone Potters Bar (0707) 51199.

ITT-IDEC

# Data Processing Professionals.

## LONDON EC4

Our client is an export finance and marketing organisation with offices in major cities throughout the world and is a subsidiary of a major banking group.

As a result of the reassessment of current requirements the company has decided to invest heavily in the data processing department in order to design and develop new on-line systems to cover the whole of the company's operations on their sophisticated and powerful minicomputer hardware.

### ANALYST PROGRAMMER

c £11,000

To assist in the development of new integrated new on-line systems while being responsible for the enhancement/maintenance of existing systems. It is envisaged that the successful candidate will have 5+ years d.p. experience coupled with a programming background.

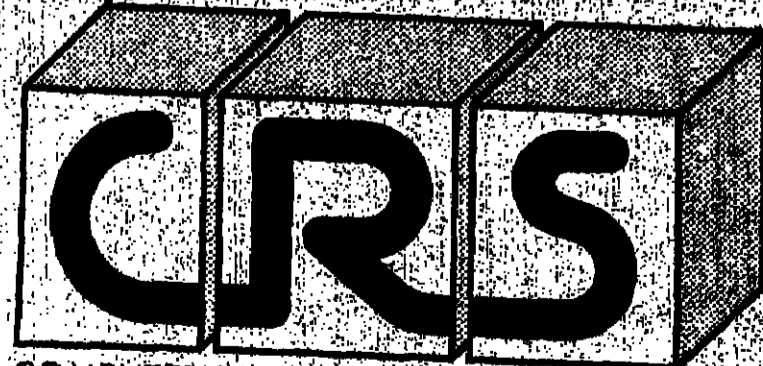

### PROGRAMMER

c £9,000

You will be working closely with the S.A. on the development of the above systems and this position therefore offers a talented programmer genuine opportunities to move into an analyst programming role. It is envisaged that the successful candidate will have 3 + years' programming experience — preferably in more than one language.

These positions carry the responsibility for projects from design through to implementation and, as such, offer excellent opportunities for career progression. Attractive company benefits are offered including L.V.s, pension scheme, and relocation expenses where applicable.

For further details please telephone immediately or write in confidence quoting reference number 53/81/CW.

COMPUTER RECRUITMENT SPECIALISTS

18 BUCKINGHAM PALACE ROAD, LONDON SW1W 0DP. TELEPHONE 01 828 1384. TELEX 24891

From nil to No. 1 in Data Entry in just 10 years is proof enough - Redifon means business. Now, with the launch of the R1800 Series and Viewdata Plus, Redifon certainly does mean BUSINESS. Or, to be exact, is out to revolutionise the electronic office market.

Incorporating a new fast processor, this remarkable, 'user friendly' integrated Office System provides everything conventional systems can. Plus unique real-time interactive viewdata. Plus IBM 3270 pass through. Plus a host of terminals. Plus text processing. Plus a host of exciting new products for 1981.

The right solution? We're convinced. So are several major companies who have systems already installed and working. Gaining a market first has put us in a very strong position. Consolidating it must be the next priority — and maintaining our impeccable levels of customer service will be crucially important. Which is where you come in.

## AUSTRALIA

### CONTRACT

### PERMANENT

Our Sydney and Melbourne Offices are in urgent need of high calibre DP personnel for both Contract and Permanent positions. The shortage of qualified personnel in Australia has created an employees' market and salary ranges are considerably higher than for the same period last year. For example, Contract Programmers are now earning between \$A15 and \$A20 per hour and Programmer/Analysts with a minimum of three years experience can expect salaries to start at \$A18,000, working progressively up to \$A26,000.

Any computer professionals planning a short working holiday in Australia or permanent residency are urged to contact our organisation at their earliest convenience providing a full resume of their work experience, together with details of arrival and preferred working location (Sydney or Melbourne). We guarantee an immediate reply with relevant information, including rates of pay and employment opportunities for someone with your particular background and experience.

Recruitment **LOGISTIX** In Informatics

### Communications Software

Southern Germany: Salary to £15K

Communications Engineers from Programmer/Analyst to Team Leader level are urgently required by one of Europe's leading suppliers of communications equipment. Software development teams, based in their R & D Headquarters, are currently engaged in the design and construction of an advanced telephony system based on Intel 8080 microprocessors. All applicants must possess at least two years' real-time software development experience on any leading mini or

micro-computer and be fluent in one high-level programming language, such as PASCAL, COBOL or PL/I. For the more senior positions it is also necessary to be familiar with an Assembler language and be capable of supervising a small team of Programmers and Analysts. Initial interviews will be held in London and those who are successful will be invited to the Company's premises prior to offers of employment being made. Ref. 1/10A

### Business Consultants

Central London: Salary to £14K

Your past experience in the Data Processing Industry has probably given you the ability to identify and solve problems from both a business and technical point-of-view. If you also have good personal communication skills and a strong desire to join a successful and prestigious Management Consultancy, then our client, based in Central London will be

very interested to hear from you. Particular requirements are for graduates aged 28 to 34, who can demonstrate extensive practical experience in the areas of Office Automation, Word Processing and Communication Networks. Respondents with specialist experience in PRESTEL and VIDEOTEX applications are especially welcome. Ref. 1/10B

### Technical & Commercial S/W

E.E.C.: Pkg. to £16K

Technical and Commercial Software Specialists are urgently sought by a leading Dutch Systems and Software House. Applicants with a commercial background will be required to have at least 3 years' programming experience in Assembler, Basic or PL/I on small, business interactive systems. Of special interest will be candidates with expe-

rience to established Structured Programming techniques. Technically-orientated applicants will be expected to possess expertise in Communications Networks, Message Switching or Process Control Systems Development. Ancillary benefits are excellent and successful applicants will be offered full relocation assistance. Ref. 1/10C

### Software Support

W. Home Counties: Salary to £13K

A leading Total Systems Supplier requires additional Analyst/Programmers and Project Leaders to join either its Customer Support or Software Development teams. Suitable applicants will have good personal communication skills and the ability to identify and solve client problems. It is essential for all positions that you offer at least 12 months

experience of analysing commercial systems. Additionally, you should be fluent in Assembler, Basic + or COBOL and have recent exposure to mini or micro computers. Candidates who have actual or potential management abilities will of course be considered for the more senior positions. Ref. 1/10D

### Process Control Programmers

N. Home Counties/EEC: Salary to £12K

Our client is one of the world leaders in the supply of Industrial Process Control Systems. Planned expansion for 1981 has produced vacancies for additional real-time Programmers to join teams engaged in the design and development of software from product planning to live running. Suitable

applicants will have at least one year's experience in either Assembler, Fortran or Pascal in a mini-computer or micro-processor environment. Those who have worked with a manufacturer or who have exposure to KOD, Foxboro or Ferranti based systems will be of particular interest. Ref. 1/10E

### Real-Time Programmers

Central London: Salary to £9K

Additional Programmers are urgently required to join the Software development team of a small but expanding Systems House based in Central London. The Company is currently engaged in the design, coding and testing of real-time software for U.K. and Overseas clients. Suitable applicants will have a degree in a numerical subject and at

least two years' real-time programming experience in either FORTRAN, COBOL or Assembler. If you have been exposed to mini-computers, especially DEC's PDP range, RP 2100, Prime 501 or Honeywell Level 6, you will be of particular interest to our clients. Ref. 1/10F

### Message Switching

Home Counties: Salaries to £13K

Senior Programmer/Designers are urgently required by a leading supplier of data and office communications equipment whose rapid planned expansion has led to a number of vacancies being created in their Software Development Department. Candidates should offer 3-5 years' Assembler Program-

ming experience in communications and networking environments. Whilst there is a preference for candidates who have worked on PDP11 mini-computers or leading micro-processors, particular hardware experience is not of paramount importance. Ref. 1/10G

## SPL in UK and Europe

Against the trend, SPL is expanding and looking for staff, particularly those prepared to work abroad.

We need:

### Data Communications Project Leaders

The sales success of the SPL ADS 365 Tandem-based message switch has created vacancies for people who have:

- significant experience in the design and implementation of software for modern data communication systems;
- project leading experience on complex real-time projects with a communications content.

Work will be based in London but with opportunities to work in Western Europe for limited periods.

### Univac 1100 System Designers

An important SPL project in Scandinavia will require in the Spring up to 5 senior technical staff to work on site on a large scale real-time project. Applicants must have:

- extensive Univac 1100 experience ideally including knowledge of DMS 1100 and TIP;
- the ability to contribute to the design and implementation of a complex international real-time system.

For all of these projects salaries are negotiable and should not be a problem for suitably qualified staff. Generous overseas allowances are paid where applicable.

If you are interested in these vacancies or feel that you have other experience that would be of value to an international Software House please write or call:

## Senior Operations Opportunities

Powerful IBM Mainframe Complex  
Advanced Real Time Network  
London

"Excellent trading profits; a healthy increase in turnover; high re-investment, continued growth; UK Market Leaders setting the standard for the industry internationally."

In today's depressed climate, an unusual business profile indeed. But then our Client presents no ordinary success story, with new and exciting business ventures growing throughout Europe and the USA.

Efficient and imaginative use of technology is an important part of this success, where this ranges from continued investment in large IBM mainframes to powerful mini computers, Real-time systems including CICS, word processing, Viewdata, and Data base systems.

To augment the Central London team they now seek two Senior Operations Professionals:-

### Senior Operator

Remuneration package in excess of £8,000 pa

Essentially possessing 3 years large IBM mainframe experience. Well versed in OS JCL and utilities. Ideally with teleprocessing knowledge.

### Deputy Shift Supervisor

Remuneration package in excess of £9,500 pa

Obviously possessing all the expertise defined above. In addition, either proven supervisory capability, or, greater technical depth with obvious supervisory potential.

Theirs is a young department, reacting to a challenging environment, and rewarding initiative and ambition; in fact genuine career opportunities exist in progression not only towards operations management, but into applications and systems programming, and operations support.

Besides an excellent salary, they offer enormously attractive travel and holiday benefits, and first class working conditions including 4 weeks holiday, season ticket loan scheme, discount on BUPA and car insurance, and subsidised restaurant.

To arrange an immediate and confidential interview, contact Dave Scarlett on 01-935 0671, or (evenings and weekends) on 01-540 2500.

London 01-935 0671 3 Mandeville Place, Wigmore Street, London W1M 5LB.

Specialist Computer Recruitment Ltd

## Systems Analysts

At present, our Management Services Department operates from a dual IBM 3033 installation, with more than 200 on-line terminals supported by IMS DB/DC; and it is projected to increase this number to 500 over the next five years.

In order that we can continue to meet the increasing demands of company activities in the commercial, production and engineering areas, we need to increase our complement of experienced Systems Analysts, with the new incumbents making a significant contribution to the development of data processing techniques.

It is expected that you will be able to make an immediate contribution, and to do so will have had at least 3 years' experience in commercial systems, including on-line and/or business experience in an industrial environment, allied to proven ability in all aspects of the Systems Analyst role, from project inception to final implementation.

Salaries are competitive, with general conditions of employment being those appropriate to a large, successful organization. Relocation assistance will be given where appropriate.

If you are interested in finding out more about these positions please write, enclosing a curriculum vitae, to:

Mr D Baines (Ref A 275) Personnel & Training Department,  
British Aerospace Public Limited Company,  
Dynamics Group, Stevenage Division,  
PO Box 19, Six Hills Way, Stevenage, Herts SG1 2DA

## Senior Operator/ D.P. Manager Designate

Brantford International Limited, part of the Furness Withy Group, is one of the largest Freight Forwarding Operators in the U.K. and is expanding internationally. The Company is introducing a new Hardware Installation at their Head Office at Barking, Essex based on the ICL ME 29 generation of equipment and is seeking a Senior Operator/DP Manager Designate to assist at the commencement of a new phase in the Company's operations. The successful candidate, probably 30 years plus, will have at least 12 months experience on ICL 2903/04 or similar equipment and will have proven supervisory experience. He/she will be expected to become totally involved in Systems Applications, in addition to the efficient day to day provision of batch/real time facilities, the selection and training of operational staff and liaising on the development and installation of peripheral equipment when desired. Future prospects for the right applicant are extremely good and the importance of this position within the Company will be reflected in the salary and benefits offered. Please telephone or write for an application form to Mr. R. Martin, Personnel Manager, Brantford International Limited, Regal House, East Street, Barking, Essex, IG11 8EY. Tel: 01-594 7181 ext. 367.

## SOUTH-WEST UNIVERSITIES REGIONAL COMPUTER CENTRE University of Bath

### VME/B SYSTEMS PROGRAMMER

Applications are invited for the post of Systems Programmer in the Operating Systems team at SWURCC. Bath University campus and is the regional computer centre for the South-West Universities Computer Network. Operating Systems is a small team responsible for maintaining and developing the VME/B operating system on a powerful ICL 2980. Development projects often involve programming in S3 (an Algol 68-like language) and immediate developments include implementing the latest signed high-level scheduler and improvements in communications software. This is a challenging post requiring a self-motivated, quick-learning individual. Experience of VME/B (or developing systems software would be an advantage. Training will be given where necessary. Salary in the range £5,505 - £9,555 (under review). Application forms and further particulars may be obtained from the Personnel Office, University of Bath, Bath BA2 7AY (0228-61244), quoting reference 8123. Closing date 20 March, 1981.

The successful candidate will be responsible for the development and maintenance of a sales network in the Lancashire area.

## SMR Sales & Marketing Recruiters Ltd Victory House, 99 Regent Street, London W1R 7HB A Sales and Marketing Services Company London & Midlands

### Sales Executives

If there is anything better than enjoying the quality of life that comes from working in such an agreeable environment as the

### West Country

it is doing so with the added value of high earnings and real job satisfaction.

Our client is a significant international manufacturer of advanced computer systems with a potential that is yet to be fully exploited. Over 1200 systems are already installed in the UK, within a variety of industrial and commercial users, and the company continues to enjoy outstanding sales success despite current economic trends. The working environment is both friendly and progressive and provides real scope for individual career advancement.

We are seeking an accomplished computer sales executive, based in Bristol, to sell the company's complete product range in the West Country. Candidates will ideally have experience of selling hardware based systems for industrial and commercial applications, but candidates from a service bureau or hardware background will also be considered.

Many companies boast about high potential earnings, but these ambitious rewards are often negated by over optimistic targets. The ability of our client to establish truly realistic sales objectives, is reflected in the fact that the majority of the company's established sales people earn in excess of

The successful candidate will be responsible for the teaching of computing to students in the college.

## SALES BIT

Professional Credibility - 3

### Creating the right kind of image in the buyer's mind

FOR the last two weeks this column has discussed the various factors involved in the establishment of professional credibility within the sales organisation. This week concludes the series by looking at further elements of the process.

Buyers are interested only in doing business with people whom they feel really understand their problems.

Our client is a significant international manufacturer of advanced computer systems with a potential that is yet to be fully exploited. Over 1200 systems are already installed in the UK, within a variety of industrial and commercial users, and the company continues to enjoy outstanding sales success despite current economic trends. The working environment is both friendly and progressive and provides real scope for individual career advancement.

We are seeking an accomplished computer sales executive, based in Bristol, to sell the company's complete product range in the West Country. Candidates will ideally have experience of selling hardware based systems for industrial and commercial applications, but candidates from a service bureau or hardware background will also be considered.

Many companies boast about high potential earnings, but these ambitious rewards are often negated by over optimistic targets. The ability of our client to establish truly realistic sales objectives, is reflected in the fact that the majority of the company's established sales people earn in excess of

£20,000 + Company Car

Please supply complete career details to Alan Williams or Alasdair Scott quoting reference TTC/103.

There can be no argument that one of the best ways to destroy professional credibility is lack of knowledge of one's own products. On the other hand, fluency in one's own portfolio, and competitive products can do much to create the right kind of image in the buyer's mind.

Once this has been established, the buyer may even go to the extent of asking the salesman for his own purposes. That's where you are really established!

An effective questioning technique and with it the ability to identify unstated or even unknown needs and desires demands a high level of sales sensitivity, concentration, attention and experience. To have this capability is to have unquestionable professional credibility.

Knowing how the company mechanism works and what is

Without it the evangelical salesman may get a conversion, but he will never gain absolute commitment (eg. that unspoken statement: "You have persuaded me that I should have such a product, but I intend to get one from a salesman and company I know I can rely on").

The establishment of this level of rapport is seldom an overnight affair. It is usually a hard-earned process involving many people and many meetings over many weeks, months or even years. Yet, it can be lost in a matter of seconds by a single error of judgment.

## COURSES

Widespread introduction of coloured visual display devices has presented many industrial designers and engineers with new problems. The University of Surrey has organised a course Colour in Visual Displays to help with the solutions. It will be held on March 26-27 at the University in Guildford. It will cover basic colour phenomena, colour measurement and specification, the visibility and reliability of displays under various viewing conditions and the use of multi-colour displays. The fee is £110. Further information from:

Mrs Pollard at the University, telephone (0483) 71281 ext 457.

A WORKSHOP concerning training on practical design and implementation of computer assisted training will be held at the Gloucester Hotel, London, on April 30-May 1 and June 4-5. The course is organised by Mills and Allen Communications in collaboration with the training services division of MSC. Further information from Billie Burnett: Mills and Allen, 1-4 Langley Court, displays, the fee is £110. Long Acree, London WC2. Further information from: Tel: 01-240 1307.

## PUZZLE ANSWER

NO integer with more than two digits can fit the bill, because even the smallest logical possibility - 102 - would require the adding of 99 in the two steps. But six digits just cannot sum to 99, so the field of search is narrowed considerably, and can

happening at any point in time within the political hierarchy is essential for both the establishment and maintenance of professional credibility. It is so easy to say or do the wrong thing at the wrong time, and find oneself out in the street with a negative professional status. Politics is a minefield; tread with care!

The market image and viability of a company can have a significant bearing on the level of professional credibility that its salespeople can achieve. A salesman can make every effort in the world to put across a good impression, but if his employer has a questionable image, or more often and equally negative, no image at all, then his chances of success are greatly reduced.

This problem can be overcome to a significant degree by starting the sales call with the company's history, philosophy and products, as well as financial viability. Good quality sales literature greatly assists a sale, as do reference clients who are relevant in terms of industry, application and location.

Good Press relations, while usually out of the salesman's control, usually offers high return for low investment.

Clearly, there are many facets to professional credibility and each sale is likely to demand different considerations and emphasis. However, there can be no escape from the basic theme, only variations on it. Professional credibility is the key to the successful conclusion of the sales negotiation.

Without it the evangelical salesman may get a conversion, but he will never gain absolute commitment (eg. that unspoken statement: "You have persuaded me that I should have such a product, but I intend to get one from a salesman and company I know I can rely on").

The establishment of this level of rapport is seldom an overnight affair. It is usually a hard-earned process involving many people and many meetings over many weeks, months or even years. Yet, it can be lost in a matter of seconds by a single error of judgment.
